- 1202-D: Called 1202-30D – Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – anti-CD4 binding site MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – CD4BS MAbs 654-D, 559/64-D, 588-D, 830-D, 1027-30-D, and 1202-30D strongly diminished proliferation. Hioe *et al.* [2000]
- 1202-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 6 CD4BS MAbs – CD4BS MAbs bound consistently to most isolates of clade D, but poorly to isolates of other clades with the exception of broadly reactive MAb IgG1b12. Nyambi *et al.* [2000] (**subtype comparisons**)
- 1202-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – CD4-BS Abs tended to bind weakly without clade specificity to virions, but bound well to soluble gp120 – 1202-D did not bind to any B clade viruses, and weakly bound A, C, and G clade isolates – 559/64-D, 558-D and 1202-D had similar reactivities. Nyambi *et al.* [1998] (**subtype comparisons**)

- 1331E: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- 1331E: Inhibits sCD4 binding to rec gp120 LAI – binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – CD4BS MAbs 559/64-D, 654-D, 729-D, 9CL and 1331E bound with a 5-13 fold preference for the oligomer. Gorny *et al.* [2000] (**antibody binding site definition and exposure**)

- 15e: UK Medical Research Council AIDS reagent: ARP3016.
- 15e: Five amino acids in the gp41 N-terminal region that promote gp140 trimerization (I535, Q543, S553, K567 and R588) were considered. Their influence on the function and antigenic properties of JR-FL Env expressed on the surfaces of pseudoviruses and Env-transfected cells was studied. Various non-neutralizing antibodies bind less strongly to the Env mutant, but neutralizing antibody binding is unaffected. 15e captured significantly fewer mutant pseudovirions than wild type, and 15e failed to inhibit infection by either pseudovirus. Dey *et al.* [2008] (**binding affinity**)
- 15e: Molecular mechanism of neutralization by MPER antibodies, 2F5 and 4E10, was studied using preparations of trimeric HIV-1 Env protein in the prefusion, the prehairpin intermediate and postfusion conformations. MAb 15e was used to analyze antigenic properties of construct 92UG-gp140-Fd, derived from isolate 92UG037.8 and stabilized by a C-terminal foldon tag. 92UG-gp140-Fd failed to bind 15e, despite high affinity of 15e for 92UG-gp120 core. Frey *et al.* [2008] (**binding affinity**)
- 15e: Sera from gp120 DNA prime-protein boost immunized rabbits competed for binding to 15e while sera from rabbits immunized with protein-only regimen did not, indicating elicitation of 15e-like Abs in animals immunized with DNA prime-protein boost regimen. Competitive virus capture assay also revealed higher titers of 15e Abs in animals immunized with DNA prime-protein boost than in protein-only immunized animals. Vaine *et al.* [2008] (**vaccine antigen design**)
- 15e: Most of the sera from guinea pigs immunized with gp120 protein or with three types of VLPs containing disulfide-shackled functional trimers (SOS-VLP), uncleaved nonfunctional Env (UNC-VLP), naked VLP bearing no Env, weakly or ineffectively inhibited virus capture compared to 15e Ab. Crooks *et al.* [2007] (**neutralization**)
- 15e: This review summarizes 15e Ab epitope, properties and neutralization activity. Kramer *et al.* [2007] (**review**)
- 15e: Molecules designed to eliminate binding by 15e while preserving epitopes of other neutralizing Abs are discussed. Lin & Nara [2007] (**review**)
- 15e: This Ab was used to determine the degree to which fixation of gp120 in its CD4-bound conformation restricts antigenic recognition. 15e was not able to bind well to the stabilized gp120. Zhou *et al.* [2007] (**antibody binding site definition and exposure**, **binding affinity**)
- 15e: Macaques were immunized with SF162gp140, ΔV2gp140, ΔV2ΔV3gp140 and ΔV3gp140 constructs and their antibody responses were compared to the broadly reactive NAb responses in a macaque infected with SHIV SF162P4, and with pooled sera from humans infected with heterologous HIV-1 isolates (HIVIG). 15e-like Abs were generated in the SHIV-infected macaque, and may have been present at very low titers in macaques immunized with ΔV2gp140 and ΔV2ΔV3gp140. No 15e Abs were detected in the sera from F162gp140 immunized animals. Derby *et al.* [2006] (**antibody binding site definition and exposure**, **antibody generation**)
- 15e: Interactions of this Ab with gp120 monomer and two cleavage-defective gp140 trimers were studied. It was shown that 15e recognized the soluble monomer and trimers much more efficiently than the GA-treated (cross-linked) monomers and trimers, indicating that the 15e epitope was affected by cross-linking. This Ab was associated with a large entropy change upon gp120 binding. 15e sucsesfully recognized untreated but not cross-linked proteins expressed on cell surfaces indicating existence of multiple conformational states of gp120 on cell surface. This Ab was shown to have a kinetic disadvantage as it bound to gp120 much slower than the highly neutralizing Abs 2G12 and IgG1b12. Yuan *et al.* [2006] (**antibody binding site definition and exposure**, **antibody interactions**, **kinetics**, **binding affinity**)
- 15e: MAbs were investigated in differnt neutralization formats, including the standard format that measures activity over the entire infection period and several formats that emphasize various stages of infection. 15e did not neutralize in standard format. Crooks *et al.* [2005] (**neutralization**, **assay standardization/improvement**)
- 15e: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mecha-

B Cell

nisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**antibody binding site definition and exposure**, **review**)

- 15e: A reverse capture assay was developed to asses what kind of human MAbs were produced in EBV B-cell transformation assays performed on PBMC sampled at different timepoints from three HIV-1 infected patients on HAART. The reverse capture assay was validated by the solid phase MAbs that could not capture biotin-MAbs of the same or overlapping specificity when reacted with patient virus envelope glycoproteins preincubated with or without sCD4. Reverse capture assay showed that the produced Abs from the patients did not block binding of biotin-labeled 15e in early samples from the patients, indicating no detection of CD4bs Abs. CD4bs Abs were only detected in significant numbers in one patient at week 168 after diagnosis. Robinson *et al.* [2005] (**antibody generation**, **assay development**, **HAART, ART**)
- 15e: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**, **review**)
- 15e: Ab neutralization of viruses with mixtures of neutralization-sensitive and neutralization-resistant envelope glycoproteins was measured. It was concluded that binding of a single Ab molecule is sufficient to inactivate function of an HIV-1 glycoprotein trimer. The inhibitory effect of the Ab was similar for neutralization-resistant and -sensitive viruses indicating that the major determinant of neutralization potency of an Ab is the efficiency with which it binds to the trimer. It was also indicated that each functional trimer on the virus surface supports HIV-1 entry independently, meaning that every trimer on the viral surface must be bound by an Ab for neutralization of the virus to be achieved. Yang *et al.* [2005c] (**neutralization**)
- 15e: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- 15e: A set of HIV-1 chimeras that altered V3 net charge and glycosylation patterns in V1V2 and V3, involving inserting V1V2 loops from a late stage primary isolate taken after the R5 to X4 switch, were studied with regard to phenotype, co-receptor usage, and MAb neutralization. The loops were cloned into a HXB2 envelope with a LAI viral backbone. It was observed that the addition of the late-stage isolate V1V2 region and the loss of V3-linked glycosylation site in the context of high positive charge gave an X4 phenotype. R5X4, R5, and X4 viruses were generated, and sCD4, 2G12 and b12 neutralization resistance patterns were modified by addition of the late stage V1V2, glycosylation changes, and charge in concert, while neutralization by 2F5 was unaffected. 15e, 17b, and 48d could not neutralize any of the variants tested. Nabatov *et al.* [2004] (**antibody binding site definition and exposure**, **co-receptor**)
- 15e: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including 15e. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- 15e: Alanine scanning mutagenesis was used to compare substitutions that affected anti-CD4BS NAb b12 – rec gp120s were engineered to contain combinations of Alanine substitutions that enhanced b12 binding, and while binding of b12 to these gp120 monomers was generally maintained or increased, binding by five non-neutralizing anti-CD4bs MAbs (b3, b6, F105, 15e, and F91) was reduced or completely abolished. Pantophlet *et al.* [2003a] (**antibody binding site definition and exposure**)
- 15e: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- 15e: This paper shows that binding of CD4BS MAbs to Env blocks the conformational shift that allows co-receptor CCR5 binding and CD4-independent mediated cell fusion. CD4BS MAbs F105, 15e, and IgG1b12 as well as their Fab fragments inhibited CD4-independent binding of the V1/V2 loop-deleted gp120 glycoproteins of R5 HIV-1 isolates ADA, YU2 and JRFL and to CCR5 in a concentration dependent manner. Raja *et al.* [2003] (**co-receptor**)
- 15e: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
- 15e: Called 1.5e. Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar.

B Cell

Enthalpy and entropy changes were divergent, but compensated. Not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs (17b, 48d, 1.5e, b6, F105 and F91) had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, but the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol, The high values suggest surface burial or protein folding an ordering of amino acids. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)

- 15e: A series of mutational changes were introduced into the YU2 gp120 that favored different conformations – 375 S/W seems to favor a conformation of gp120 closer to the CD4-bound state, and is readily bound by sCD4 and CD4i MAbs (17b, 48d, 49e, 21c and 23e) but binding of anti-CD4BS MAbs (F105, 15e, IgG1b12, 21h and F91 was markedly reduced – IgG1b12 failed to neutralize this mutant, while neutralization by 2G12 was enhanced – 2F5 did not neutralize either WT or mutant, probably due to polymorphism in the YU2 epitope – another mutant, 423 I/P, disrupted the gp120 bridging sheet, favored a different conformation and did not bind CD4, CCR5, or CD4i antibodies, but did bind to CD4BS MAbs. Xiang *et al.* [2002b] (**antibody binding site definition and exposure**)
- 15e: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002] (**antibody binding site definition and exposure**)
- 15e: Mutations in two glcosylation sites in the V2 region of HIV-1 ADA at positions 190 and 197 (187 DNTSYRLINCNTS 199) cause the virus to become CD4-independent and able to enter cells through CCR5 alone – these same mutations tended to increase the neutralization sensitivity of the virus, including to 15e. Kolchinsky *et al.* [2001] (**antibody binding site definition and exposure**)
- 15e: Six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. Park *et al.* [2000] (**antibody binding site definition and exposure**)
- 15e: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer – CD4BS MAbs 15e, F91 and IgG1b12 bound better to the deleted protein than to wild type. Binley *et al.* [1998] (**antibody binding site definition and exposure**)
- 15e: CD4BS MAbs 15e, 21h, and F91 bind with even lower affinity than 205-43-1 and 205-42-15 to JRFL oligomer. Fouts *et al.* [1998] (**antibody binding site definition and exposure**)
- 15e: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a] (**antibody binding site definition and exposure**)
- 15e: Competes with CG-10 binding, a MAb raised against a gp120 CD4 complex, this was probably due to the disruption of CD4-gp120 by 15e. Sullivan *et al.* [1998b] (**antibody binding site definition and exposure**, **antibody interactions**)
- 15e: Called 1.5e – the HIV-1 virus YU2 entry can be enhanced by MAbs binding to the CD4BS, V3 loop, and CD4i epitopes – the activation for this enhanced entry state could be conferred on HxB2 by introducing the YU2 V3 loop, or the YU2 V3 and V1/V2 loops – a similar effect is observed by sub-neutralizing concentrations of sCD4 and the effect is dependent of CCR5 – 1.5e enhances and does not neutralize YU2 env even at 50 ug/ml. Sullivan *et al.* [1998a] (**antibody binding site definition and exposure**)
- 15e: No detectable neutralizing activity among primary isolates with different co-receptor usage – some neutralization of TCLA strains. Trkola *et al.* [1998] (**variant cross-recognition or cross-neutralization**)
- 15e: Summary of the implications of the crystal structure of the core of gp120 bound to CD4 and 17b with what is known about mutations that reduce NAb binding – probable mechanism of neutralization by CD4BS Ab is direct interference with CD4 binding. Wyatt *et al.* [1998] (**structure**)
- 15e: Called 1.5E – Binds to 7/7 isolates from breakthrough cases from a MN gp120 vaccine trial. Berman *et al.* [1997] (**variant cross-recognition or cross-neutralization**)
- 15e: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 15e bound monomer, did not bind oligomer or neutralize JRFL. Fouts *et al.* [1997] (**antibody binding site definition and exposure**)
- 15e: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env – 15e could only achieve 50% neutralization, but could act synergistically with anti-V3 MAb 694/98-D to achieve 90%. Li *et al.* [1997] (**antibody interactions**)
- 15e: Neutralizes TCLA strains, but not primary isolates. Parren *et al.* [1997b]
- 15e: Does not bind to HXBc2 gp120 if the 19 C-term amino acids, in conjunction with C1 positions 31-93, are deleted. Wyatt *et al.* [1997] (**antibody binding site definition and exposure**)

- 15e: Neutralizes HIV-1 LAI less potently than V3 specific MAbs. McDougal *et al.* [1996]
- 15e: Called 1.5e – Neutralizes HXB2, but fails to neutralize chimeric virus with gp120 from primary isolates in an HXB2 background. McKeating *et al.* [1996] (**variant cross-recognition or cross-neutralization**)
- 15e: gp120 binding enhanced by anti-V3 MAb 5G11 and anti-V2 MAb G3-136 – binding inhibited by other CD4 binding site MAbs, antibodies that bind to gp120 only when CD4 is bound, and CD4-IgG. Moore & Sodroski [1996] (**antibody interactions**)
- 15e: Anti-CD4BS MAbs 15e, 21h, and IgG1b12 did not cause gp120 dissociation from virus, or exposure of the gp41 epitope of MAb 50-69, in contrast to CD4i MAb 48d and anti-V3 neutralizing MAbs. Poignard *et al.* [1996a] (**antibody interactions**)
- 15e: Inhibits gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a] (**antibody binding site definition and exposure**)
- 15e: 15e is V H4 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. Wisnewski *et al.* [1996] (**antibody sequence variable domain**)
- 15e: The V4 and V5 domains are essential for 1.5e binding, in contrast to the V1, V2, and V3 loops. Lee *et al.* [1995] (**antibody binding site definition and exposure**)
- 15e: Binds with higher affinity to monomer than to oligomer, moderate association rate. Sattentau & Moore [1995] (**antibody binding site definition and exposure**)
- 15e: Heavy chain is V HIV, V2-1 – light chain is V_kappaI, Hum01/012. Compared to 21h and F105. Bagley *et al.* [1994] (**antibody sequence variable domain**)
- 15e: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – anti-CD4 MAbs moderately inhibit gp120 binding to GalCer, possibly through steric hindrance – binding of GalCer to gp120 inhibited but did not completely block 15e binding. Cook *et al.* [1994] (**antibody binding site definition and exposure**, **brain/CSF**)
- 15e: Cross-reactive with gp120 proteins from clades B and D, less so with A and C, and not reactive with clade E and F. Moore *et al.* [1994b] (**subtype comparisons**)
- 15e: A mutation in gp41, 582 A/T, confers resistance to neutralization (also confers resistance to MAbs F105, 48d, 21h and 17b).. Thali *et al.* [1994] (**antibody binding site definition and exposure**)
- 15e: Conformational, does not bind denatured gp120 – neutralizes IIIB – reactive with SF-2 gp120 – strong inhibition of HIV+ human sera binding to IIIB gp120. Moore & Ho [1993] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 15e: Called 15E – a neutralization escape mutant (HXB2 A281V) was selected by growth of HXB2 in the presence of broadly neutralizing sera – 15E neutralization was not affected by this mutation. Watkins *et al.* [1993] (**antibody binding site definition and exposure**)
- 15e: Binding to Delta V1/2 and Delta V1/2/3 mutant glycoproteins is greater than binding to wildtype gp120. Wyatt *et al.* [1993] (**antibody binding site definition and exposure**)
- 15e: gp120 mutants that affect 15e epitope binding: 113, 257, 368, 370, 421, 427, 475 – four of these coincide with amino acids important for the CD4 binding domain. Ho *et al.* [1992] (**antibody binding site definition and exposure**)
- 15e: Amino acid substitutions in HXB2 that strongly inhibit binding, similar to Ho *et al.* [1992], some additional, 88, 102, 117, 113, 257, 368, 370, 421, 427, 457, 470, 480 Thali *et al.* [1992a]. Ho *et al.* [1992]; Thali *et al.* [1992a] (**antibody binding site definition and exposure**)
- 15e: Called N70-1.5e – does not enhance infection of HIV-1 IIIB and MN. Thali *et al.* [1992a] (**enhancing activity**)
- 15e: Precipitation of Delta 297-329 env glycoprotein, with a deleted V3 loop, is much more efficient that precipitation of wild type. Wyatt *et al.* [1992] (**antibody binding site definition and exposure**)
- 15e: Cross-competes with MAbs ICR 39.13g and ICR 39.3b. Cordell *et al.* [1991] (**antibody interactions**)
- 15e: Broadly neutralizing, binds multiple strains, competes with CD4 for gp120 binding, DTT reduction of env abrogates binding – more potent blocking of gp120-sCD4 binding than MAbs G3-536 and G3-537.. Ho *et al.* [1991b] (**adjuvant comparison**, **variant cross-recognition or cross-neutralization**)
- 15e: Binds to gp120 of HIV-1 IIIB, but not RF – mediates ADCC – deletion of the V3 loop from gp120 does not alter ADCC activity. Koup *et al.* [1991] (**ADCC**, **variant cross-recognition or cross-neutralization**)

- 21h: UK Medical Research Council AIDS reagent: ARP3017.

B Cell

- 21h: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**vaccine antigen design**, **review**)
- 21h: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- 21h: A series of mutational changes were introduced into the YU2 gp120 that favored different conformations—375 S/W seems to favor a conformation of gp120 closer to the CD4-bound state, and is readily bound by sCD4 and CD4i MAbs (17b, 48d, 49e, 21c and 23e) but binding of anti-CD4BS MAbs (F105, 15e, IgG1b12, 21h and F91) was markedly reduced—IgG1b12 failed to neutralize this mutant, while neutralization by 2G12 was enhanced—2F5 did not neutralize either WT or mutant, probably due to polymorphism in the YU2 epitope—another mutant, 423 I/P, disrupted the gp120 bridging sheet, favored a different conformation and did not bind CD4, CCR5, or CD4i antibodies, but did bind to CD4BS MAbs. Xiang *et al.* [2002b] (**antibody binding site definition and exposure**)
- 21h: CD4BS MAbs 15e, 21h, and F91 bind with even lower affinity than 205-43-1 and 205-42-15 to JRFL oligomer – conclusions of this paper contrast with Parren *et al.* [1998a] Fouts *et al.* [1998]. Fouts *et al.* [1998]; Parren *et al.* [1998a] (**binding affinity**)
- 21h: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a] (**antibody binding site definition and exposure**)
- 21h: Summary of the implications of the crystal structure of the core of gp120 bound to CD4 and 17b with what is known about mutations that reduce NAb binding – probable mechanism of neutralization by CD4BS Ab is direct interference with CD4 binding. Wyatt *et al.* [1998] (**antibody binding site definition and exposure**, **structure**)
- 21h: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 21h bound monomer, did not bind oligomer or neutralize JRFL. Fouts *et al.* [1997] (**antibody binding site definition and exposure**)
- 21h: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env – 50% neutralization could not be achieved at a maximal concentration of 67 mug/ml. Li *et al.* [1997] (**variant cross-recognition or cross-neutralization**)
- 21h: Neutralizes TCLA strains, but not primary isolates. Parren *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- 21h: Viral binding inhibition by 21h strongly correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5). Ugolini *et al.* [1997] (**antibody binding site definition and exposure**)
- 21h: Binds both gp120 and soluble gp120+gp41 complex efficiently, suggesting its gp120 epitope is not blocked by gp41 binding – major deletions in C1 and C5 and deletions of the V1V2 and V3 loops do not diminish binding. Wyatt *et al.* [1997] (**antibody binding site definition and exposure**)
- 21h: Called 2.1H – Neutralizes HXB2, but fails to neutralize chimeric virus with gp120 from primary isolates in an HXB2 background. McKeating *et al.* [1996] (**variant cross-recognition or cross-neutralization**)
- 21h: Anti-CD4 binding site MAb – reciprocal inhibition by anti-C1, -C4 and other anti-CD4 binding site antibodies – enhanced by some anti-V2 MAbs and anti-V3 MAb 5G11 – enhances binding of some anti-V3 and -V2 MAbs. Moore & Sodroski [1996] (**antibody interactions**)
- 21h: Anti-CD4BS MAbs 15e, 21h, and IgG1b12 did not cause gp120 dissociation from virus, or exposure of the gp41 epitope of MAb 50-69, in contrast to CD4i MAb 48d and anti-V3 neutralizing MAbs. Poignard *et al.* [1996a] (**antibody binding site definition and exposure**, **antibody interactions**)
- 21h: 21h is V H3 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. Wisnewski *et al.* [1996] (**antibody sequence variable domain**)
- 21h: Binds with higher affinity to monomer than to oligomer, moderate association rate. Sattentau & Moore [1995] (**antibody binding site definition and exposure**)
- 21h: Heavy chain is V HIII, VDP-35 – light chain is V_lambdaIIIa, Hum318. Compared to 15e and F105. Bagley *et al.* [1994] (**antibody sequence variable domain**)
- 21h: Has strong cross-reactivity with gp120 monomers from most subtypes, A-F, with the least reactivity to clade E. Moore *et al.* [1994b] (**subtype comparisons**)
- 21h: Competition studies with human sera from seroconverting individuals showed that anti-CD4 BS antibodies can arise very early in infection, comparable or prior to anti-V3 antibodies. Moore *et al.* [1994a] (**acute/early infection**)
- 21h: A mutation in gp41, 582 A/T, confers resistance to neutralization (also confers resistance to MAbs F105, 48d, 15e and 17b). Thali *et al.* [1994] (**variant cross-recognition or cross-neutralization**)
- 21h: Conformational, does not bind denatured gp120 – neutralizes IIIB – reactive with SF-2 gp120 – strong inhibition of HIV+ human sera binding to IIIB gp120. Moore & Ho [1993] (**antibody binding site definition and exposure**)
- 21h: Binding to Delta V1/2 and Delta V1/2/3 mutant glycoproteins is greater than binding to wildtype gp120. Wyatt *et al.* [1993] (**antibody binding site definition and exposure**)
- 21h: Amino acid substitutions in HXB2 that inhibit binding, some shared with CD4 binding inhibition, 88, 113, 257, 368, 370, 421, 470, 480. Thali *et al.* [1992a] (**antibody binding site definition and exposure**)

- 38G3/A9: This Ab bound weakly to gp120IIIb and it had a weak inhibitory effect on gp120 antigen presentation by MHC class II. Lysosomal enzyme digestion of gp120 treated with 38G3/A9 yielded fragmentation similar to that of gp120 alone, and digestion rate was intermediate, between the rapid digestion of gp120 alone and the slow digestion of gp120 in complex with high-affinity Ab5145A. It is thus concluded that

B Cell

CD4bs Ab 38G3/A9, with low affinity to gp120, does not have a strong inhibitory effect on gp120 processing and presentation. Tuen *et al.* [2005] (**antibody interactions**, **binding affinity**)

- 448D: This review summarizes 448D Ab epitope, properties and neutralization activity. Kramer *et al.* [2007] (**review**)
- 448D: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**antibody binding site definition and exposure**, **review**)
- 448D: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**vaccine antigen design**, **review**)
- 448-D: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- 448-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 6 CD4BS MAbs – CD4BS MAbs bound consistently to most isolates of clade D, but poorly to isolates of other clades with the exception of broadly reactive MAb IgG1b12. Nyambi *et al.* [2000] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 448-D: Summary of the implications of the crystal structure of the core of gp120 bound to CD4 and 17b with what is known about mutations that reduce NAb binding – probable mechanism of neutralization by CD4BS Ab is direct interference with CD4 binding. Wyatt *et al.* [1998] (**structure**)
- 448-D: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env. Li *et al.* [1997] (**variant cross-recognition or cross-neutralization**)
- 448-D: Neutralizing activity, positive ADCC activity, and no viral enhancing activity. Forthal *et al.* [1995] (**ADCC**, **enhancing activity**)
- 448-D: Virions complexed to gp120 Ab facilitate presentation of p66 RT epitopes to Th cells. Manca *et al.* [1995a]
- 448-D: Dissociation constant gp120 IIIB 0.029 – neutralizes IIIB, acts synergistically with anti-V3 MAb 447-52D. Laal *et al.* [1994] (**antibody interactions**)
- 448-D: Did not mediate deposition of complement component C3 on HIV infected cells. Spear *et al.* [1993] (**complement**)
- 448-D: Conformational – reactive with IIIB gp120 in RIP, but not WB assay. Karwowska *et al.* [1992a] (**antibody binding site definition and exposure**)
- 448-D: Called 448D – blocks gp120-CD4 binding – substitutions at gp120 residues 88, 113, 117, 257, 368 and 370 reduce binding – epitope similar to rat MAbs 39.13g and 39.3b.

- 5145A: A significantly higher level of anti-V3 Ab (694/98D) and anti-C1 mAb (EH21) bound to gp120 complexed with 5145A mAb than to gp120 alone or in complex with other non-CD4bs Abs, indicating that binding of 5145A to gp120 increases exposure of specific V3 and C1 mAb epitopes. Visciano *et al.* [2008b]
- 5145A: This Ab was used to select phages from two different peptide libraries. Synthetic peptides corresponding to the selected phage sequences were fused to either phage pIII protein or a small heat shock protein. The constructs were able to inhibit binding of 5145A to gp120, and were able to induce antibodies that bound to recombinant gp120 in immunized rabbits. The induced Abs did not, however, bind to HIV-1 infected cells, nor did they neutralize HIV. Sera from the immunized rabbits did not inhibit binding of 5145A to gp120. Wilkinson *et al.* [2007] (**antibody generation**, **neutralization**)

B Cell

- 5145A: This study is about the V2 MAb C108g, that is type-specific and neutralizes BaL and HXB2. JR-FL is a neutralization resistant strain; modification of JRFL at V2 positions 167 and 168 (GK->DE) created a C108g epitope, and C108g could potently neutralize the modified JR-FL. The modification in V2 also increased neutralization sensitivity to V3 MABs 4117c, 2219, 2191, and 447-52D, but only had minor effects on neutralization by CD4BS MAb 5145A, and broadly neutralizing MAbs IgG1b12, 2G12, and 2F5. A modification in the NAb sensitive isolate SF162 to introduce the C108g epitope, including the introduction of a glycosylation site (160-161 KV -> NI) and 167-169 NKM -> GKV, decreased neutralization sensitivity to 5145A more than 50-fold. 5145A is a disulfide-dependent epitope in the CD4 binding domain that is lost after reduction; C108g, contrary to earlier reports, was also shown to require disulfide bonds. Pinter *et al.* [2005] (**anti-idiotype**, **antibody binding site definition and exposure**)
- 5145A: This Ab bound with a high affinity to gp120IIIb and it strongly suppressed gp120 antigen presentation by MHC class II. Binding of 5145A to gp120 did not prevent uptake of gp120 by APCs. 5145A did not, however, disassociate from gp120 at acidic pH, suggesting that gp120-5145A complexes remain stable in the APC endolysosomes. Lysosomal enzyme digestion of gp120 in complex with 5145A was slow and yielded limited fragmentation of gp120 with distinct patterns. It is thus concluded that poorly neutralizing high-affinity CD4bs Abs produced by chronically infected patients prevent the stimulation of gp120-specific CD4 T-cell responses by producing gp120-Ab complexes resistant to the proteolytic processing by lysosomal enzymes. Tuen *et al.* [2005] (**antibody interactions**, **binding affinity**, **rate of progression**)
- 5145A: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization**)
- 5145A: V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neturalization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12, which neutralized both strains), neutralized the SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype. Three anti-CD4BS MAbs were tested, including IgG1b12, which neutralizes both JRFL and SF162. The affinities for IgG1b12 and 5145A were similar for both JRFL and SF612, but 1125A bound with 2.5 fold higher affinity to SF162. 5145A and 1125H both preferentially neutralize SF162, but not JRFL, and the CD4BS is more sensitive to neutralization in the context of the SF162 V1V2 loop. This was also true for neutralization by sCD4. Pinter *et al.* [2004] (**variant cross-recognition or cross-neutralization**)
- 5145A: Transgenic mice carrying human genes allowing production of fully human MAbs were used to rapidly create a panel of anti-HIV gp120 MAb producing hybridomas by immunization with HIV SF162 gp120 – the previously described human MAbs 5145A, 4117C and 697D were used as controls. He *et al.* [2002]
- 5145A: A study of 6 anti-Env MAbs and their ability to bind or direct ADCC against target cells infected with IIIB, MN, SF-2, and RF – bound and directed lysis against all four strains. Alsmadi & Tilley [1998] (**ADCC**)
- 5145A: A panel of immunotoxins were generated by linking Env MAbs to ricin A – immunotoxins mediated cell killing, but killing was not directly proportional to binding. Pincus *et al.* [1996] (**immunotoxin**)
- 5145A: Synergistic neutralization of HIV-1 when combined with anti-V2 MAb C108G. Warrier *et al.* [1996] (**antibody interactions**)
- 5145A: Potent and broadly cross-reactive neutralization of lab strains. Pinter *et al.* [1993a] (**variant cross-recognition or cross-neutralization**)

- 559/64D: A significantly higher level of anti-V3 Ab (694/98D) and anti-C1 mAb (EH21) bound to gp120 complexed with 559/64D mAb than to gp120 alone or in complex with other non-CD4bs Abs, indicating that binding of 559/64D to gp120 increases exposure of specific V3 and C1 mAb epitopes. Immunization of mice with gp120-559/64D complex elicited higher and faster V3-specific Ab responses than immunization with gp120 alone or gp120 in complex with other mAbs, while responses to other gp120 regions was comparable. Abs elicited by immunization with gp120-559/64D complex reacted preferentially with the homologous V3 peptide, and the sera from immunized mice neutralized homologous, but not heterologous, HIV-1 isolates. Visciano *et al.* [2008b] (**neutralization**, **vaccine antigen design**)
- 559/64D: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody interactions**, **neutralization**, **vaccine antigen design**, **review**)
- 559/64D: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- 559/64D: called 559-64D: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
- 559/64-D: CD4BS MAbs when complexed with gp120, inhibit proliferation of gp120-specific CD4 T-cells and IFNγ production—anti-CD4BS MAbs inhibit gp120 presentation by altering the uptake and/or processing of gp120 by the APCs, not by blocking of gp120 attachment to CD4 on the surface of APCs. Hioe *et al.* [2001]
- 559/64-D: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4 induced or CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding. York *et al.* [2001] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 559/64-D: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – CD4BS MAbs 559/64-D, 654-D, 729-D, 9CL and 1331E bound with a 5-13 fold preference for the oligomer. Gorny *et al.* [2000] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 559/64-D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – anti-CD4 binding site MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – CD4BS MAbs 654-D, 559/64-D, 588-D, 830-D, 1027-30-D, and 1202-30D strongly diminished proliferation. Hioe *et al.* [2000]
- 559/64-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 6 CD4BS MAbs – CD4BS MAbs bound consistently to most isolates of clade D, but poorly to isolates of other clades with the exception of broadly reactive MAb IgG1b12. Nyambi *et al.* [2000] (**subtype comparisons**)
- 559/64-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – CD4BS Abs tended to bind weakly without clade specificity to virions, but bound well to soluble gp120 – 559/64-D did not bind to any B clade viruses, and weakly bound clade A, C, and G isolates – 559/64-D, 558-D and 1202-D had similar reactivities. Nyambi *et al.* [1998] (**antibody binding site definition and exposure**, **subtype comparisons**)
- 559/64-D: Used in the development of resting cell neutralization assay. Hioe *et al.* [1997a] (**assay development**)
- 559/64-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593

B Cell

and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. Hioe *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)

- 559/64-D: Called 559 – slight, not significant increased binding when V1/V2 or V1/V2 and V3 were deleted from gp120. Jeffs *et al.* [1996] (**antibody binding site definition and exposure**)
- 559/64-D: Neutralizing activity, no ADCC activity, and no viral enhancing activity. Forthal *et al.* [1995] (**ADCC**, **enhancing activity**, **variant cross-recognition or cross-neutralization**)
- 559/64-D: Called 559-64D – The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates with differences in cell tropism was studied – CD4BS loop epitopes are somewhat occluded in the oligomeric gp120 epitopes on the virion surface relative to the gp120 monomer as indicated by an increase in the half-maximal binding values to macrophage-tropic isolates SF162 and SF128a and to T-cell tropic SF2 – binding of anti-CD4BS MAbs to SF2 resulted in a significant amount of dissociation of gp120 from virion surface. Stamatatos & Cheng-Mayer [1995] (**antibody binding site definition and exposure**)
- 559/64-D: Did not mediate deposition of complement component C3 on HIV infected cells. Spear *et al.* [1993] (**complement**)
- 559/64-D: Conformational – reactive with IIIB gp120 in RIP, but not WB assay. Karwowska *et al.* [1992a] (**antibody binding site definition and exposure**)

- 654-D: Variable domains of three heavy chain Abs, the VHH, were characterized. The Abs were isolated from llamas, who produce immunoglobulins devoid of light chains, immunized with HIV-1 CRF07_BC, to gp120. It was hypothesized that the small size of the VHH, in combination with their protruding CDR3 loops, and their preference for cleft recognition and binding into active sites, may allow for recognition of conserved motifs on gp120 that are occluded from conventional Abs. 654-D was found to compete for binding to recombinant gp120 with the three neutralizing VHH Abs, indicating overlapping epitopes or steric hinderance. Forsman *et al.* [2008] (**binding affinity**)
- 654D: A significantly higher level of anti-V3 Abs (694/98D and 447-52D) and anti-C1 mAb (EH21) bound to gp120 complexed with 654D mAb than to gp120 alone or in complex with other non-CD4bs Abs, indicating that binding of 654D to gp120 increases exposure of specific V3 and C1 mAb epitopes. Immunization of mice with gp120-654D complex elicited higher and faster V3-specific Ab responses than immunization with gp120 alone or gp120 in complex with other mAbs, while responses to other gp120 regions was comparable. Abs elicited by immunization with gp120-654D complex reacted preferentially with the homologous V3 peptide, and the sera from immunized mice neutralized homologous, but not heterologous, HIV-1 isolates. Visciano *et al.* [2008b] (**vaccine antigen design**)
- 654: A mouse CD4 T cell clone proliferated well in response to gp120 alone but this response was inhibited by more than 80% when gp120 was complexed with mAb 654. Mice immunized with gp120-654 complex showed lower levels of lymphoproliferation than mice immunized with gp120-670 complex, indicating that anti-CD4bs Abs supress the induction of CD4 T cell responses in vivo. However, mice immunized with gp120/654 Ab displayed faster kinetics and higher levels of gp120-specific serum IgG and IgA, but not IgM, indicating that immunization with gp120 in the presence of anti-CD4 Ab alters the immunogenicity of gp120 such that the immune response is dominated by anti-gp120 IgG. Visciano *et al.* [2008a] (**vaccine-induced epitopes**, **kinetics**)
- 654-D: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- 654-30D: Point mutations in the highly conserved structural motif LLP-2 within the intracytoplasmic tail of gp41 resulted in conformational alternations of both gp41 and gp120. The alternations did not affect virus CD4 binding, coreceptor binding site exposure, or infectivity of the virus, but did result in decreased binding and neutralization by certain MAbs and human sera. 654-30D exhibited similar levels of binding to both the LLP-2 mutant and wildtype viruses, indicating that its epitope was not altered by the mutation. Kalia *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)
- 654-D (650-D): This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody interactions**, **vaccine antigen design**, **review**)
- 654D: This Ab bound with a high affinity to gp120IIIb and it strongly suppressed gp120 antigen presentation by MHC class II. Binding of 654D to gp120 did not prevent uptake of gp120 by APCs nor did it inhibit transport of gp120 into the endolysosomes of the APCs. 654D did not, however, disassociate from gp120 at acidic pH, suggesting that gp120-654D complexes remain stable in the APC endolysosomes. Lysosomal enzyme digestion of gp120 in complex with 654D was slow and yielded limited fragmentation of gp120 with distinct patterns. It is thus concluded that poorly neutralizing high-affinity CD4bs Abs produced by chronically infected patients prevent the stimulation of gp120-specific CD4 T-cell responses by producing gp120-Ab complexes resistant to the proteolytic processing by lysosomal enzymes. Tuen *et al.* [2005] (**antibody interactions**, **binding affinity**, **rate of progression**)
- 654-D: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- 654-D: Called 654-30D. scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the follow-

B Cell

ing regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. Zwick *et al.* [2003] (**antibody interactions**)

- 654-D: Called 654: Conformation-dependent anti-V3 loop Abs may be more cross-reactive, so six new V3 MAbs were generated – the six new MAbs all bind to the tip of the V3 loop and cross-compete with the MAb 447-52D and are conformationally sensitive – MAbs showed cross-clade binding to native, intact virions and the strength binding was highly correlated with percent neutralization using the ghost cell or PHA blast assay – five well-characterized MAbs were used as controls: anti-V3 447-52D (anti-V3 MAb for competition and neutralization studies), 654 (anti-CD4BS used as a conformation-sensitive MAb control), 1331A (anti-C5 used as a linear binding site MAb control), and MAb 246 (anti-gp41 MAb that bound to primary isolates of all clades) Gorny *et al.* [2002]
- 654-D: CD4BS MAbs when complexed with gp120, inhibit proliferation of gp120-specific CD4 T-cells and IFN gamma production – anti-CD4BS MAbs inhibit gp120 presentation by altering the uptake and/or processing of gp120 by the APCs, not by blocking of gp120 attachment to CD4 on the surface of APCs. Hioe *et al.* [2001]
- 654-D: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6—six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D, while six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281—no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. Verrier *et al.* [2001] (**antibody interactions**, **variant cross-recognition or cross-neutralization**)
- 654-D: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – CD4BS MAbs 559/64-D, 654-D, 729-D, 9CL and 1331E bound with a 5-13 fold preference for the oligomer. Gorny *et al.* [2000] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 654-D: Ab responses, because of their capacity to alter antigen uptake and processing, can influence helper T cell responses – CD4BS MAbs or serum Ig from HIV+ individuals inhibited proliferative responses of gp120 specific T cells – MAb 654-D strongly diminished proliferation – there is a discrepancy in isotyping this antibody, previous reports indicated IgG1kappa, while Hioe suggests it is IgG1lambda. Hioe *et al.* [2000]
- 654-D: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 6 CD4BS MAbs – CD4BS MAbs bound consistently to most isolates of clade D, but poorly to isolates of other clades with the exception of broadly reactive MAb IgG1b12 – 654-D had the weakest binding among CD4BS MAbs, binding to only 4/26 isolates. Nyambi *et al.* [2000] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 654-D: The presence of leukocyte function-associated molecule 1 (LFA-1) promotes virus infectivity and hinders neutralization, and anti-LFA-1 MAbs can enhance the neutralizing effect of anti-HIV V3 MAb 447-52D and anti-HIV CD4BS MAb IgG1b12 – non-neutralizing anti-HIV CD4BS MAb 654-D did not become neutralizing in the presence of anti-LFA-1 MAbs. Hioe *et al.* [1999]
- 654-D: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – CD4-BS Abs tended to bind very weakly without clade specificity to virions, but bound well to soluble gp120 – 654-D bound only to JRFL. Nyambi *et al.* [1998] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 654-D: Called 654-D100 – 654-D100 and IgG1b12 neutralized viruses HIV-BRU and a mutated virus that lacks the V3 loop glycan equally effectively – in contrast, sera from guinea pigs immunized with BRU gp120 neutralize viruses more effectively that lack the V3 glycan. Schonning *et al.* [1998] (**variant cross-recognition or cross-neutralization**)
- 654-D: Called 654.30D – deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V2 but not V1 slightly allowed neutralization by CD4BS MAb 654.30D. Stamatatos & Cheng-Mayer [1998] (**antibody binding site definition and exposure**, **subtype comparisons**)
- 654-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal sera/plasma tested and not at all by MAbs individually or by a cocktail of ten MAbs consisting of 419-D, 447-52D, 782-D, 838-D, 559/64-D, 654-D, 450-D, 670-D, 1281-D and 98-6. Hioe *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- 654-D: Called 654-30D – One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env. Li *et al.* [1997] (**variant cross-recognition or cross-neutralization**)
- 654-D: Anti-CD4 BS MAb 654-30D and IgG1b12 have comparable binding affinities, neither mediates gp120-virion dissociation, but IgG1b12 can neutralize SF128A and SF162 and 654-D cannot – 654-D actually enhances infection by both viruses in primary macrophages. Stamatatos *et al.* [1997] (**enhancing activity**, **binding affinity**)
- 654-D: Called 654-30D – The binding of conformation-dependent anti-V2, anti-V3, and anti-CD4BS MAbs to monomeric and virion-associated gp120 from HIV-1 isolates

B Cell

with differences in cell tropism was studied – CD4BS loop epitopes are somewhat occluded in the oligomeric gp120 epitopes on the virion surface relative to the gp120 monomer as indicated by an increase in the half-maximal binding values to macrophage-tropic isolates SF162 and SF128a and to T-cell tropic SF2 – binding of anti-CD4BS MAbs to SF2 resulted in a significant amount of dissociation of gp120 from virion surface. Stamatatos & Cheng-Mayer [1995] (**antibody binding site definition and exposure**)

- 654-D: Mild oxidation of carbohydrate moieties inhibits binding. Gorny *et al.* [1994] (**antibody binding site definition and exposure**)
- 654-D: Dissociation constant gp120 IIIB 0.008 – neutralizes IIIB, acts synergistically with anti-V3 MAb 447-52D – reported to be human(IgG1lambda) Laal *et al.* [1994] (**antibody interactions**, **kinetics**)

Keywords antibody interactions, binding affinity, review, variant cross-recognition or cross-neutralization

- 67G6/C4: This Ab did not bind to gp120IIIb, it did not prevent uptake of gp120 by APCs,and had no inhibitory effect on gp120 antigen presentation by MHC class II. Lysosomal enzyme digestion of gp120 treated with 67G6/C4 yielded digestion rate and fragmentation similar to that of gp120 alone. It is thus concluded that CD4bs Ab 67G6/C4, with low affinity to gp120, does not inhibit gp120 processing and presentation. Tuen *et al.* [2005] (**antibody interactions**, **binding affinity**)
- 67G6/C4: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database. Most neutralize TCLA strains only, this MAb is one of four that are non-neutralizing. Gorny & Zolla-Pazner [2004] (**review**)
- 67G6/C4: Transgenic mice (strain XenoMouse G2) carrying human genes allowing production of fully human IgG2κ MAbs were used to rapidly create a panel of anti-HIV gp120 MAb-producing hybridomas by immunization with HIV SF162 gp120—6 anti-CD4BS MAbs competed with anti-CD4BS MAb 5145A, blocked sCD4 binding and were conformationally sensitive—4/6 could neutralize the autologous strain SF162, and were broadly cross-reactive with B clade R5 and X4 strains (not E clade)—67G6/C4 could not neutralize autologous SF162, and its binding was strain-specific. He *et al.* [2002] (**variant cross-recognition or cross-neutralization**)

Keywords isotype switch, mucosal immunity, neutralization

- D25: Several IgG MAbs were isotype switched to IgA and tested for their abilities to generate immune complexes with HIV-1 and be excreted from polarized epithelial cells from the basolateral to the apical surface via polymeric Ig receptor (pIgR) binding. IgA D25 was able to excrete HIV but it had lower level of binding to the virus, and as immune complex to the pIgR, than D10 and D47 MAbs. These results show that IgA Abs have potential to excrete HIV from mucosal lamina propria thus decreasing the viral burden and access to susceptible cells. Wright *et al.* [2008] (**isotype switch**, **mucosal immunity**)
- D25: By isotype switching, IgG and IgA variants of D25 were produced. Both D25 IgA and IgG showed no significant neutralization of virus in conventional neutralization assays nor did they show any capability of intracellular neutralization of HIV-1. Huang *et al.* [2005b] (**isotype switch**, **neutralization**, **mucosal immunity**)

Keywords antibody binding site definition and exposure, antibody generation, binding affinity, review, variant cross-recognition or cross-neutralization

- DO8i: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this Fab, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- DA48: The rank order of Fab binding affinity to monomeric gp120 (Loop 2 > 3B3 > b12 = DO8i > b11 > b3 > b14 > b13 > DO142-10 > DA48 > L17) was markedly different than Fab binding affinity to the mature oligomeric form (3B3 > b12 > DO142-10 > Loop 2 > b11 > L17 > b6 > DO8i > b14 > DA48 > b3 > b13) and binding to oligomeric form and neutralization were correlated for both Fabs and MAbs – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a] (**binding affinity**)
- DA48: The HIV-1 virus YU2 entry can be enhanced by MAbs binding to the CD4BS, V3 loop, and CD4i epitopes – the activation for this enhanced entry state could be conferred on HxB2 by introducing the YU2 V3 loop, or the YU2 V3 and V1/V2 loops – a similar effect is observed by sub-neutralizing concentrations of sCD4 and the effect is dependent of CCR5 – Fab Ab fragment DA48 also enhances YU2 entry, ruling out Fc interactions or Env cross-linking as a mechanism – while DA48 enhances YU2, it neutralizes HXBc2 – DA48 was obtained by panning libraries derived from bone marrow from a >15 year long term non-progressor against BRU gp120. Sullivan *et al.* [1998a] (**antibody binding site definition and exposure**, **antibody generation**, **variant cross-recognition or cross-neutralization**)

Keywords ADCC, antibody binding site definition and exposure, antibody generation, antibody interactions, antibody sequence variable domain, assay development, binding affinity, brain/CSF, co-receptor, complement, dendritic cells, enhancing activity, escape, immunoprophylaxis, immunotherapy, immunotoxin, kinetics, mimics, mother-to-infant transmission, mucosal immunity, neutralization, rate of progression, review, structure, subtype comparisons, vaccine antigen design, vaccine-specific epitope characteristics, variant cross-recognition or cross-neutralization

- F105: No neutralization of primary isolates observed (John Moore, pers comm). (**variant cross-recognition or cross-neutralization**)
- F105: NIH AIDS Research and Reference Reagent Program: 857.
- F105: A series of peptide conjugates were constructed via click reaction of both aryl and alkyl acetylenes with an internally incorporated azidoproline 6 derived from parent peptide RINNIPWSEAMM. Many of these conjugates exhibited increase in both affinity for gp120 and inhibition potencies at both the CD4 and coreceptor binding sites. All high affinity peptides inhibited the interactions of YU2 gp120 with F105 Ab. The aromatic, hydrophobic, and steric features in the residue 6 side-chain were found important for the increased affinity and inhibition of the high-affinity peptides. Gopi *et al.* [2008]
- F105: A new purification method was developed using a high affinity peptide mimicking CD4 as a ligand in affinity chromatography. This allowed the separation in one step of HIV envelope monomer from cell supernatant and capture of pre-purified trimer. Binding of F105 to gp120SF162 purified by the miniCD4 affinity chromatography and a multi-step method was comparable, suggesting that the miniCD4 allows the separation of HIV-1 envelope with an intact F105 epitope. gp140DF162ΔV2 was purified by the miniCD4 method to asses its ability to capture gp140 trimers. Binding of F105 to gp140DF162ΔV2 purified by the miniCD4 affinity chromatography and a multi-step method was comparable, suggesting that the SF162 trimer antigenicity was preserved. Martin *et al.* [2008] (**assay development**, **binding affinity**)
- F105: Two HIV-1 isolates, NL4-3 and KB9, were adapted to replicate in cells using the common marmoset receptors CD4 and CXCR4. The adaptation resulted in a small number of changes of env sequences in both isolates. The adapted NL4-3 variants were generally more sensitive to neutralization by

F105 than the adapted KB9 variants. All of the NL4-3 exhibited similar sensitivity to neutralization by F105 except for the viruses containing the V242I change, which exhibited a slight increase in neutralization sensitivity to F105. Wildtype KB9 is resistant to neutralization by F105 but the changes associated with adaptation to marmoset receptors resulted in variants with increased sensitivity to neutralization by F105. Thus, adaptation to marmoset receptors resulted in an increase in sensitivity to neutralization by F105 for KB9 but not for NL4-3. Pacheco *et al.* [2008] (**neutralization**)

- F105: Neutralization of HIV-1 IIIB LAV isolate by F105 was within the same range as the neutralization of the virus by natural antibodies from human sera against the gal(α1,3)gal disaccaride linked to CD4 gp120-binding peptides, indicating that the activity of natural antibodies can be re-directed to neutralize HIV-1. Perdomo *et al.* [2008] (**neutralization**)
- F105: A significantly higher level of anti-V3 Ab (694/98D) and anti-C1 mAb (EH21) bound to gp120 complexed with F105 mAb than to gp120 alone or in complex with other non-CD4bs Abs, indicating that binding of F105 to gp120 increases exposure of specific V3 and C1 mAb epitopes. Visciano *et al.* [2008b]
- F105: F105 was tested for its ability to induce conformational changes similar to those induced by CD4. Although presence of sCD4 increased neutralization of JRFL by 447-52D and immune sera rich in V3-Abs from guinea pigs, the presence of F105 did not, indicating that F105 does not induce a conformation alternation in Env that exposes the V3 loop to neutralizing Abs. Wu *et al.* [2008]
- F105: F105 bound exclusively to cells expressing gp120 in a co-receptor-independent manner. Although binding and uptake of F105 was increased with increased expression of gp120 on the cell surface, efficient internalization in short amount of time was possible even in cells expressing low levels of gp120. Internalized F105 was localized to the Golgi compartment. Kinetic analyses of F105 binding to gp120 demonstrated a heterogeneous mode of binding that did not trigger a conformational change in the formed complex. Compared to sCD4, F105 had a higher gp120 affinity, due to slower dissociation. Clayton *et al.* [2007] (**co-receptor**, **kinetics**, **binding affinity**)
- F105: gp120 proteins with double mutation T257S+S375W, which alters the cavity at the epicenter of the CD4 binding region, decreased F105 recognition to an undetectable level. The S375W single mutation also disrupted the binding surface of the F105 Ab. Dey *et al.* [2007b] (**binding affinity**)
- F105: A D386N change in the V4 region, which results in restoration of N-glycosylation at this site, did not have any impact on the neutralization of a mutant virus by F105 compared to wildtype. Also, there was no association between increased sensitivity to F105 neutralization and enhanced macrophage tropism. Dunfee *et al.* [2007] (**neutralization**)
- F105: A recombinant gp120-Fc, used in an assay to determine 2G12 epitope contribution to DC-SIGN binding to gp120, bound to F105, indicating it was conformationally intact. Hong *et al.* [2007] (**binding affinity**)
- F105: This review summarizes F105 Ab epitope, properties and neutralization activity. F105 use in passive immunization studies in primates and possible mechanisms explaining protection against infection are discussed. Kramer *et al.* [2007] (**immunotherapy**, **review**)
- F105: 32 human HIV-1 positive sera neutralized most viruses from clades A, B, and C. Two of the sera stood out as particularly potent and broadly reactive. IgG eluted from gp120 wildtype and core protein from the sera were readsorbed with the gp120-D368R mutant protein to remove non-CD4-binding site Abs. Binding of the resulting flow-through core eluate/368ft IgG to gp120 was completely blocked by Fab F105. Fab F105 also blocked most of the binding of the gp120WT eluate/368ft IgG, indicating that these Ab fractions were highly enriched with CD4-binding site Abs. Li *et al.* [2007b] (**neutralization**)
- F105: F105 structure, binding and neutralization are reviewed in detail. Molecules designed to eliminate binding by F105 while preserving epitopes of other neutralizing Abs are discussed. Lin & Nara [2007] (**review**, **structure**)
- F105: A chimeric protein entry inhibitor, L5, was designed consisting of an allosteric peptide inhibitor 12p1 and a carbohydrate-binding protein cyanovirin (CNV) connected via a flexible linker. The L5 chimera inhibited F105-gp120 interaction, but the CNV alone did not, indicating that the chimera has the high affinity binding property of the CNV molecule and the inhibitory property of the 12p1 peptide. McFadden *et al.* [2007]
- F105: This review provides information on the HIV-1 glycoprotein properties that make it challenging to target with neutralizing Abs. F105 neutralization properties and binding to HIV-1 envelope, and current strategies to develop versions of the Env spike with functional trimer properties for elicitation of broadly neutralizing Abs, are discussed. In addition, approaches to target cellular molecules, such as CD4, CCR5, CXCR4, and MHC molecules, with therapeutic Abs are reviewed. Phogat *et al.* [2007] (**review**)
- F105: Compared to the full-length Con-S gp160, chimeric VLPs containing Con-S ΔCFI gp145 with transmembrane (TM) and cytoplasmic tail (CT) sequences derived from the mouse mammary tumor virus (MMTV), showed higher binding capacity to F105. Chimeric VLPs with only CT derived from MMTV also showed higher binding capacity to F105 than the full-length Con-S gp160, however, not as high as the chimeric CT-TM VLPs. Wang *et al.* [2007a] (**binding affinity**)
- F105: This Ab was used to select phages from two different peptide libraries. Synthetic peptides corresponding to the selected phage sequences showed slight inhibition of F105 binding to gp120. F105 did not bind to synthetic peptides to 5145A MAb fused to phage pIII protein. Sera from rabbits immunized with 5145A peptide-phage pIII protein did not inhibit binding of F105 to gp120. Wilkinson *et al.* [2007] (**antibody generation**)
- F105: This Ab was used to determine the degree to which fixation of gp120 in its CD4-bound conformation restricts antigenic recognition. F105 was not able to bind well to the stabilized gp120. Zhou *et al.* [2007]
- F105: Macaques were immunized with SF162gp140, ΔV2gp140, ΔV2ΔV3gp140 and ΔV3gp140 constructs and their antibody responses were compared to the broadly reactive NAb responses in a macaque infected with SHIV

B Cell

SF162P4, and with pooled sera from humans infected with heterologous HIV-1 isolates (HIVIG). F105 bound to SF162gp140 but a deletion of V2 or V3 loops from the gp140 construct reduced the binding. Derby *et al.* [2006] (**antibody binding site definition and exposure**)

- F105: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- F105: The crystal structure of this Ab was compared to the high resolution crystal structure of Fab m18. Although the variable domains of m18 and F105 showed sequence similarity, the H3s of these Abs showed distinct conformations. Similarly, the H2s conformations of these Abs differed. Prabakaran *et al.* [2006] (**antibody binding site definition and exposure**, **mimics**, **antibody sequence variable domain**, **structure**)
- F105: The major infectivity and neutralization differences between a PBMC-derived HIV-1 W61D strain and its T-cell line adapted counterpart were conferred by the interactions of three Env amino acid substitutions, E440G, D457G and H564N. Chimeric Env-pseudotyped virus Ch5, containing all three of the mutations, was more neutralization sensitive to F105 than Ch2, which did not contain any of these mutations. Neutralization sensitivity to F105 by Env-pseudotyped viruses containing D457G mutation alone, or in combination with E440G or H564N, was unaffected compared to mutants lacking this mutation. Binding of F105 to gp120 derived from Env-pseudotyped viruses was unaffected by any of these mutations. Beddows *et al.* [2005b] (**neutralization**, **binding affinity**)
- F105: All clones derived from biopanning using IgG1b12 bound to this Ab but not to the control Ab F105. Dorgham *et al.* [2005] (**antibody binding site definition and exposure**)
- F105: Point mutations in the highly conserved structural motif LLP-2 within the intracytoplasmic tail of gp41 resulted in conformational alternations of both gp41 and gp120. The alternations did not affect virus CD4 binding, coreceptor binding site exposure, or infectivity of the virus, but did result in decreased binding and neutralization by certain MAbs and human sera. F105 exhibited similar levels of binding to both the LLP-2 mutant and wildtype viruses, indicating that its epitope was not altered by the mutation. Kalia *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)
- F105: A series of genetically modified Env proteins were generated and expressed in both insect and animal cells to be monitored for their antigenic characteristics. For F105, modified protein 3G (mutations in 3 glycosylation sites) showed the highest binding to this Ab compared to the other Env proteins. Kang *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)
- F105: The HIV-1 Bori-15 variant was adapted from the Bori isolate for replication microglial cells. Bori-15 had increased replication in microglial cells and a robust syncytium-forming phenotype, ability to use low levels of CD4 for infection, and increased sensitivity to neutralization by sCD4 and 17b. Four amino acid changes in gp120 V1-V2 were responsible for this change. Protein functionality and integrity of soluble, monomeric gp120-molecules derived from parental HIV-1 Bori and microglia-adapted HIV-1 Bori-15 was assessed in ELISA binding assays using CD4BS MAbs F105 and IgG1b12, glycan-specific 2G12, and V3-specific 447-52D, and were unchanged. Association rates of sCD4 and 17b were not changed, but dissociation rates were 3-fold slower for sCD4 and 14-fold slower for 17b. Martín-García *et al.* [2005] (**antibody binding site definition and exposure**)
- F105: A chimeric cell surface receptor (105TCR) was designed consisting of the single chain Fv domain of F105, CD8α hinge and the transmembrane, and the cytoplasmic domains of TCRζ. 105TCR was successfully expressed on the surface of T-cells. It mediated full activation of T-cells leading to cytokine production when bound to gp120 on the surface of an infected cell. It did not bind to soluble gp120. Retrovirally transduced CD8+ cells expressed high levels of 105TCR and were able to lyse HIV-1 envelope expressing cells specifically in an MHC-unrestricted manner. Masiero *et al.* [2005] (**immunotherapy**)
- F105: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**antibody binding site definition and exposure**, **antibody interactions**, **neutralization**, **variant cross-recognition or cross-neutralization**, **immunotherapy**, **review**)
- F105: JR-FL and YU2 HIV-1 strains were not neutralized by F105. F105 and other non-neutralizing Abs only recognized JR-FL cleavage-defective glycoproteins, while the neutralizing Abs (2G12 and IgG1b12) recognized both cleavage competent and cleavage-defective glycoproteins. It is suggested that an inefficient env glycoprotein precursor cleavage exposes non-neutralizing determinants, while only neutralizing regions remain accessible on efficiently cleaved spikes. For YU2, both cleavage-competent and -defective glycoproteins were recognized by both neutralizing and non-neutralizing Abs. F105, along with other Abs able to neutralize lab-adapted isolates, displayed enhanced viral entry at higher Ab concentrations, whereas the Abs that cannot neutralize any virus did not display such enhancement. Pancera & Wyatt [2005] (**antibody binding site definition and exposure**, **enhancing activity**, **neutralization**, **binding affinity**)
- F105: A stable trimerization motif, GCN4, was appended to the C terminus of YU2gp120 to obtain stable gp120 trimers (gp120-GCN4). Each trimer subunit was capable of binding IgG1b12, indicating that they were at least 85% active. D457V mutation in the CD4 binding site resulted in a decreased affinity of the gp120-GCN4 for CD4, but the mutation did not affect binding of F105. F105 was able to bind to both wildtype gp120, gp120-GCN4, and to the respective corresponding mutant molecules D457Vgp120 and D457Vgp120-GCN4. Pancera *et al.* [2005] (**binding affinity**)
- F105: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a

B Cell

series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. CD4BS MAbs except Fab b12 (b6, b3, F105) did not bind to either GDMR or mCHO. Selvarajah *et al.* [2005] (**vaccine antigen design**, **vaccine-specific epitope characteristics**)

- F105: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**, **immunotherapy**, **mother-to-infant transmission**, **review**)
- F105: A T-cell line adapted strain (TCLA) of CRF01_AE primary isolate DA5 (PI) was more neutralization sensitive to F105 than the primary isolate. Mutant virus derived from the CRF01_AE PI strain, that lacked N-linked glycosylation at position 197 in the C2 region of gp120, was significantly more sensitive to neutralization by F105 then the PI strain. Deglycosylated subtype B mutants at positions 197 and 234 were significantly more neutralizable by F105 than the parental strain. Teeraputon *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **subtype comparisons**)
- F105: The crystal structure of the Fab fragment from F105 was solved. It has an extended CDR H3 loop, with a Phe at the apex that may recognize the binding pocket of gp120 used by the Phe-42 residue of CD4. The potent NAB IgG1b12 recognizes an overlapping binding site, the main difference is that F105 extends across the interface of the inner and outer domains of gp120 while b12 does not. IgG1b12 also has undergone extensive affinity maturation (45 mutations) while F105 has not (13 mutations) – an average for gp120 MAbs is 22 mutations. Wilkinson *et al.* [2005] (**antibody sequence variable domain**, **structure**)
- F105: Ab neutralization of viruses with mixtures of neutralization-sensitive and neutralization-resistant envelope glycoproteins was measured. It was concluded that binding of a single Ab molecule is sufficient to inactivate function of an HIV-1 glycoprotein trimer. The inhibitory effect of the Ab was similar for neutralization-resistant and -sensitive viruses indicating that the major determinant of neutralization potency of an Ab is the efficiency with which it binds to the trimer. It was also indicated that each functional trimer on the virus surface supports HIV-1 entry independently, meaning that every trimer on the viral surface must be bound by an Ab for neutralization of the virus to be achieved. Yang *et al.* [2005c] (**neutralization**)
- F105: A substantial fraction of soluble envelope glycoprotein trimers contained inter-subunit disulfide bonds. Reduction of these disulfide bonds had little effect on binding of the F105 to the glycoprotein indicating that the inter-S-S bonds had no impact on the exposure of F105 epitope. Yuan *et al.* [2005] (**antibody binding site definition and exposure**)
- F105: The peptide 12p1 (RINNIPWSEAMM) inhibits direct binding of YU2 gp120 or Env trimer to CD4, CCR5 and MAb 17b in a concentration-dependent allosteric manner. 12p1 is thought to bind to unbound gp120 near the CD4 binding site, with a 1:1 stoichiometry. 12p1 also inhibited MAb F105 binding. presumably because F105 favors an unactivated conformation, but not MAbs 2G12 or b12. The 1:1 stoichiomtry, the fact that the peptide binding site is accessible on the trimer, the non-CD4 like aspect of the binding, and an ability to inhibit viral infection in cell cultures make 12p1 a promising lead for therapeutic design. Biorn *et al.* [2004]
- F105: NAbs against HIV-1 M group isolates were tested for their ability to neutralize 6 randomly selected HIV-1 O group strains. F105 was not particularly effective at neutarlizing HIV-1 group O strains. Ferrantelli *et al.* [2004a] (**variant cross-recognition or cross-neutralization**)
- F105: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- F105: The role of serine proteases on HIV infection was explored. Trypsin decreased the binding of most Env MAb tested and diminished cell fusion of H9 cells infected with HIV-1 LAI virus (H9/IIIB) to MAGI cells. In contrast, thrombin increased the binding of MAbs to gp120 epitopes near the CD4 and CCR5 binding sites, and increased cell fusion. Binding of CD4BS MAb F105 was decreased by trypsin, but increased by thrombin. Thrombin may increase HIV-induced cell fusion in blood by causing a conformational activating shift in gp120. Ling *et al.* [2004] (**antibody binding site definition and exposure**)
- F105: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including F105. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- F105: The ability of F105 to neutralize R5, R5X4 and X4 primary isolates was compared to that of MAbs 17b, E51 and 412d. F105 neutralized the R5 ADA virus more efficiently than 17b, comparable to 412d, however, it neutralized R5X4 isolate 89.6 less efficiently than 412d and E51. F105 was, on the other hand, more efficient in neutralizing the X4 isolate HXBc2 than the other MAbs. Choe *et al.* [2003] (**neutralization**)
- F105: Env genes derived from uncultured brain biopsy samples from four HIV-1 infected patients with late-stage AIDS were compared to env genes from PBMC samples. Brain isolates did not differ in the total number or positions of N-glycosylation sites, patterns of coreceptor usage, or ability to be recognized by gp160 and gp41 MAbs. F105 recognized most variants,some from each of the four individuals by gp120 immunoprecipitation. Ohagen *et al.* [2003] (**brain/CSF**, **variant cross-recognition or cross-neutralization**)

B Cell

- F105: Alanine scanning mutagenesis was used to compare substitutions that affected anti-CD4BS NAb b12 – rec gp120s were engineered to contain combinations of Alanine substitutions that enhanced b12 binding, and while binding of b12 to these gp120 monomers was generally maintained or increased, binding by five non-neutralizing anti-CD4bs MAbs (b3, b6, F105, 15e, and F91) was reduced or completely abolished. Pantophlet *et al.* [2003a] (**antibody binding site definition and exposure**)
- F105: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- F105: Virion capture assays are not a good preditor of neutralization, and the presentation of epitopes using this assay seems to be different from that of functional Envelope spikes on primary isolates – F105 and b6 could efficiently block the b12-mediated capture of infectious virions in a virus capture, but did not inhibit b12 neutralization – while b12 was potent at neutralizing the three primary virions JR-CSF, ADA, and 89.6, the Abs F105, 19b, and Fab b6 were overall very poor neutralizers. Poignard *et al.* [2003] (**antibody interactions**)
- F105: This paper shows that binding of CD4BS MAbs to Env blocks the conformational shift that allows co-receptor CCR5 binding and CD4-independent mediated cell fusion. CD4BS MAbs F105, 15e, and IgG1b12 as well as their Fab fragments inhibited CD4-independent binding of the V1/V2 loop-deleted gp120 glycoproteins of R5 HIV-1 isolates ADA, YU2 and JR-FL and to CCR5 in a concentration dependent manner. CD4BS MAbs IgG1b12, F91 and F105 and their Fab counterparts (except for C11, used as a negative control) inhibited CD4-independent JR-FL and YU-2 gp120-CCR5 binding to CCR5-expressing Cf2Th cells and syncytium formation. Raja *et al.* [2003] (**antibody binding site definition and exposure**, **co-receptor**)
- F105: 17b: This paper describes the generation of CD4i MAb E51, that like CD4i MAb 17b, blocks CCR5 binding to sCD4-bound gp120. The substitutions E381R, F383S, R419D I420R, K421D, Q422L, I423S, and Y435S (HXB2 numbering) all severely reduce 17b and E51 binding. All but I423S also diminish CCR5 binding by more than 50%. The mutation F383S also inhibits sCD4 binding and F105 binding, and K421D inhibits F105 binding, but not sCD4. Xiang *et al.* [2003] (**antibody binding site definition and exposure**)
- F105: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
- F105: gp120 mutants were used to define the CXCR4 binding site using CXCR4 displayed on paramagnetic proteoliposomes (PMPLs) to reduce non-specific gp120 binding—basic residues in the V3 loop and the β19 strand (RIKQ, positions 419-422) were involved, and deletion of the V1-V2 loops allowed CD4-independent CXCR4 binding—MAbs 17b (CD4i) and F105 (CD4BS) were used to study conformational changes in the mutants—the affinity of ΔV1 and ΔV1-V2 mutants for F105 was comparable to the wildtype—V3 mutants did not affect F105 binding—the K421A mutation in the β19 strand dramatically reduced F105 affinity, consistent with what is known about the F105 epitope. Basmaciogullari *et al.* [2002] (**antibody binding site definition and exposure**)
- F105: This study examined Ab interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4 isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate. Anti-gp41 MAb F240 enhanced the binding of CD4BS MAbs IgG1b12 and F105 to both R5X4 and R5 isolates, but had no effect on neutralization. Anti-V3 MAb B4a1 increased CD4BS MAbs IgG1b12 and F105 to R5X4 virions, but only IgG1b12 binding was increased by B4a1 to the R5 isolate, and neutralization was not impacted. Cavacini *et al.* [2002] (**co-receptor**)
- F105: A modified gp140 (gp140deltaCFI), with C-term mutations intended to mimic a fusion intermediate and stabilize trimer formation, retained antigenic conformational determinants as defined by binding to CD4 and to MAbs 2F5, 2G12, F105, and b12, and enhanced humoral immunity without diminishing the CTL response in mice injected with a DNA vaccine. Chakrabarti *et al.* [2002] (**vaccine antigen design**)
- F105: Review of NAbs that notes that F105 binds the CD4BS, in combination with other MAbs it can protect some macaques against SHIV infection, and that it has strong ADCC activity. Ferrantelli & Ruprecht [2002] (**ADCC**, **antibody interactions**, **immunoprophylaxis**, **review**)
- F105: HIV-1 gp160δCT (cytoplasmic tail-deleted) proteoliposomes (PLs) containing native, trimeric envelope glycoproteins from R5 strains YU2 and JRFL, and X4 strain HXBc2, were made in a physiologic membrane setting as candidate immunogens for HIV vaccines—2F5 bound to gp160δCT with a reconstituted membrane ten-fold better than the same protein on beads, while such an affinity difference was not seen with F105 and 2G12—anti-CD4BS MAbs IgG1b12 and F105, A32 (C1-C4), C11 (C1-C5), and 39F (V3) MAbs bound gp160δCT PLs indistinguishably from gp160δCT expressed on the cell surface. Grundner *et al.* [2002] (**antibody binding site definition and exposure**)
- F105: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar. Enthalpy and entropy changes were divergent, but compensated. Not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs (17b, 48d, 1.5e, b6, F105 and F91) had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120

B Cell

monomer, but the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. The high values suggest surface burial or protein folding and ordering of amino acids. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)

- F105: A pseudotyping assay showed that an X4 V3 loop peptide could enhance infectivity of X4 virus, R5 and R5X4 V3 loops peptides could enhance infectivity of an R5 virus, and R5X4 peptides could enhance infectivity of an R5X4 virus. Neither R5 nor R5X4 peptides influenced binding of CD4BS MAbs F105 and Ig1Gb12, but did increase binding of CD4i MAb 17b. Ling *et al.* [2002] (**antibody binding site definition and exposure**, **co-receptor**)
- F105: Review of NAbs that discusses mechanisms of neutralization, passive transfer of NAbs and protection in animal studies, and vaccine strategies. Liu *et al.* [2002] (**immunoprophylaxis**)
- F105: A series of mutational changes were introduced into the YU2 gp120 that favored different conformations – 375 S/W seems to favor a conformation of gp120 closer to the CD4-bound state, and is readily bound by sCD4 and CD4i MAbs (17b, 48d, 49e, 21c and 23e) but binding of anti-CD4BS MAbs (F105, 15e, IgG1b12, 21h and F91 was markedly reduced – IgG1b12 failed to neutralize this mutant, while neutralization by 2G12 was enhanced – 2F5 did not neutralize either WT or mutant, probably due to polymorphism in the YU2 epitope – another mutant, 423 I/P, disrupted the gp120 bridging sheet, favored a different conformation and did not bind CD4, CCR5, or CD4i antibodies, but did bind to CD4BS MAbs. Xiang *et al.* [2002b] (**antibody binding site definition and exposure**)
- F105: Passive immunization of neonate macaques with a combination of F105+2G12+2F5 conferred complete protection against oral challenge with SHIV-vpu+ or – the combination b12+2G12+2F5 conferred partial protection against SHIV89.6 – such combinations may be useful for prophylaxis at birth and against milk born transmission – the synergistic combination of IgG1b12, 2G12, 2F5, and 4E10 neutralized a collection of HIV clade C primary isolates. Xu *et al.* [2002] (**immunoprophylaxis**, **mother-to-infant transmission**)
- F105: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin—stabilized oligomer gp140δ683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and C11, A32, and 30D which did not bind the stabilized oligomer. Yang *et al.* [2002] (**vaccine antigen design**)
- F105: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002] (**antibody binding site definition and exposure**)
- F105: Mutations in two glcosylation sites in the V2 region of HIV-1 ADA at positions 190 and 197 (187 DNTSYRLINCNTS 199) cause the virus to become CD4-independent and able to enter cells through CCR5 alone – these same mutations tended to increase the neutralization sensitivity of the virus, including to F105. Kolchinsky *et al.* [2001] (**antibody binding site definition and exposure**)
- F105: SHIV-HXBc2 is a neutralization sensitive non-pathogenic virus, and several *in vivo* passages through monkeys yielded highly pathogenic SHIV KU-1—HXBc2 and the KU-1 clone HXBc2P3.2 differ in 12 amino acids in gp160—substitutions in both gp120 and gp41 reduced the ability of sCD4, IgG1b12, F105 and AG1121 to Env achieve saturation and full occupancy, and neutralize KU-1—17b and 2F5 also bound less efficiently to HXBc2P3.2, although 2G12 was able to bind both comparably. Si *et al.* [2001] (**antibody binding site definition and exposure**)
- F105: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding. York *et al.* [2001] (**antibody binding site definition and exposure**)
- F105: A triple combination of 2F5, F105 and 2G12 effectively neutralized perinatal infection of macaque infants when challenged with SHIV-vpu+ – the plasma half-life was 7.2 +/- 2.2 days. Baba *et al.* [2000] (**immunoprophylaxis**, **mother-to-infant transmission**)
- F105: Host encoded intercellular adhesion molecule (ICAM-1) is incorporated by the HIV-1 virion and enhances viral infectivity – ICAM-1 does not modify virus sensitivity to antibodies 0.5beta or 4.8D or sCD4, but neutralizing ability of F105 was diminished in ICAM bearing virions in the presence of lymphocyte function-association antigen-1 (LFA-1) Ab. Fortin *et al.* [2000]
- F105: Six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form, although F105 was an exception and cannot neutralize either form of MN – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. Park *et al.* [2000]
- F105: A mini-review of observations of passive administration of IgG NAbs conferring protection against intervenous or

B Cell

vaginal SHIV challenge, that considers why IgG MAbs might protect against mucosal challenge. Robert-Guroff [2000] (**immunoprophylaxis**, **mucosal immunity**, **review**)

- F105: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. Yang *et al.* [2000] (**vaccine antigen design**)
- F105: A comparison of 25 gp120 specific, conformation dependent MAbs was done and F105 was used for competition studies – F105 did cross-compete with multiple CD4BS specific MAbs, however most could not neutralize even the autologous NL4-3 strains. Sugiura *et al.* [1999] (**antibody interactions**)
- F105: Immunoprecipitation of gp120 and gp160 expressed from a rec Semliki Forest virus by F105 and IgG1b12 indicated that the SFV expressed HIV-1 Env was folded appropriately – and SVF-HIV-1 Env vaccine gave the strongest anti-HIV-1 Env response in mice, when compared to an HIV-1 Env DNA vaccine and a rgp160 protein. Brand *et al.* [1998] (**vaccine antigen design**)
- F105: Phase I dose escalation study, single dose of 100 or 500 mg/m2 was given to 4 HIV+ patients – sustained levels, no immune response against F105, no toxicity, infused Ab retained function – there was no evidence of anti-HIV-1 activity and virus was not diminished at day 1 or 7, by culture or plasma RNA. Cavacini *et al.* [1998b] (**kinetics**, **immunotherapy**)
- F105: The MAb F240 binds to the immunodominant region of gp41 and enhances infection in the presence of complement – reactivity of F240 is enhanced by preincubation of cells with sCD4 or anti-CD4BS MAb F105. Cavacini *et al.* [1998a] (**antibody interactions**)
- F105: Anti-C1 region MAb 87-135/9 blocks gp120 interaction with CD4+ cells – blocking activity is additive when combined with antibodies which bind in the C4 region of gp120 (F105, 388/389, and b12). Kropelin *et al.* [1998] (**antibody interactions**)
- F105: Neutralization synergy was observed when the MAbs 694/98-D (V3), 2F5 (gp41), and 2G12 (gp120 discontinuous) were used in combination, and even greater neutralizing potential was seen with the addition of a fourth MAb, F105 (CD4 BS). Li *et al.* [1998] (**antibody interactions**)
- F105: F105 enhances viral entry of viruses carrying the YU2 envelope glycoproteins, but neutralizes HXBc2. Sullivan *et al.* [1998a] (**enhancing activity**)
- F105: Summary of the implications of the crystal structure of the core of gp120 bound to CD4 and 17b with what is known about mutations that reduce NAb binding – probable mechanism of neutralization by CD4BS Ab is direct interference with CD4 binding. Wyatt *et al.* [1998] (**antibody binding site definition and exposure**, **structure**)
- F105: Virus with the V1-V2 loop deleted was viable and more susceptible to neutralization by CD4i MAb 17b, and anti-V3 MAbs 1121, 9284, and 110.4, but not to a CD4BS MAb, F105 or sCD4. Cao *et al.* [1997b] (**antibody binding site definition and exposure**)
- F105: In a multilaboratory blinded study, failed to neutralize any of nine B clade primary isolates. D'Souza *et al.* [1997] (**variant cross-recognition or cross-neutralization**)
- F105: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env – F105 could only achieve 50% neutralization alone – all Ab combinations tested showed synergistic neutralization – F105 has synergistic response with MAbs 694/98-D (anti-V3), 48d, 2F5, and 2G12, and also with HIVIG. Li *et al.* [1997] (**antibody interactions**, **variant cross-recognition or cross-neutralization**)
- F105: Neutralizes TCLA strains, but not primary isolates. Parren *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- F105: Binds both gp120 and soluble gp120+gp41 complex efficiently, suggesting its gp120 epitope is not blocked by gp41 binding – does not bind to HXBc2 gp120 if the 19 C-term amino acids, in conjunction with C1 positions 31-93, are deleted. Wyatt *et al.* [1997] (**antibody binding site definition and exposure**)
- F105: Intracellular co-expression of heavy and light chains of the Fab105 fragment MAb F105 was enhanced by inclusion of an internal ribosome entry site (IRES) sequence – the Fab105 IRES expression cassette was cloned into an adeno-associated virus (AAV) shuttle vector, and transduced into human lymphocytes which were able to produce and secrete the Fab105 fragments while maintaining normal growth – several primary HIV-1 patient isolates were effectively blocked. Chen *et al.* [1996] (**immunotherapy**)
- F105: The sulfated polysaccharide curdlan sulfate (CRDS) binds to the Envelope of T-tropic viruses and neutralizes virus – deletion of the V3 loop results in less potent inhibition of F105 binding by CRDS – binding site of F105 described as 256-257 ST, 368-370 DPE, 421 K, and 470-484 PGGGDMRDNWRSELY. Jagodzinski *et al.* [1996] (**antibody binding site definition and exposure**)
- F105: Binding of F105 to oligomeric gp120 occurs despite the fact it cannot neutralize primary isolates. Litwin *et al.* [1996]
- F105: Neutralizes HIV-1 LAI less potently than V3 specific MAbs. McDougal *et al.* [1996]
- F105: A panel of immunotoxins were generated by linking Env MAbs to ricin A – immunotoxins mediated cell killing, but killing was not directly proportional to binding. Pincus *et al.* [1996] (**immunotoxin**)
- F105: F105 is V H4 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. Wisnewski *et al.* [1996] (**antibody sequence variable domain**)
- F105: Phase I study – MAb clearance in plasma has a 13 day half-life. Wolfe *et al.* [1996] (**kinetics**, **immunotherapy**)
- F105: Changing heavy chain from IgG1 to IgG3 increased neutralization efficiency. Cavacini *et al.* [1995]
- F105: Biotinylated F105 was used for competition studies with Ab derived from pregnant HIV-1 + women – a correla-

B Cell

tion between maternal anti-CD4 BS Abs overlapping the F105 binding site and lack of HIV-1 transmission to infants was noted. Khouri *et al.* [1995] (**mother-to-infant transmission**)

- F105: Eight patient phase Ia trial for use as an immunotherapeutic – no clinical or biochemical side effects observed, plasma levels of 10 ug/ml maintained for 21 days. Posner *et al.* [1995] (**immunotherapy**)
- F105: Efficient neutralization of T-cell adapted lines HXBc2 and MN, no neutralization of primary isolates 89.6, ADA and YU2 – even some enhancement of infection of ADA and YU2 was observed. Sullivan *et al.* [1995] (**enhancing activity**, **variant cross-recognition or cross-neutralization**)
- F105: An immunoassay for titrating CD4BS serum antibody was developed using a gp120-coated solid phase and competition with MAb F105 – 109/110 French HIV-1 + sera and 51/56 HIV-1 + African sera had detectable CD4BS Abs using this assay, demonstrating CD4 binding site conservation among diverse subtypes – CD4BS Abs were detected soon after seroconversion and persisted – 0/21 HIV-2 + sera reacted, indicating that the HIV-1 and HIV-2 CD4BS Abs are not cross-reactive. Turbica *et al.* [1995] (**assay development**, **subtype comparisons**)
- F105: Comparison of MAb F105 sequences with those of MAbs 21h and 15e. Bagley *et al.* [1994] (**antibody sequence variable domain**)
- F105: Administered intravenously to four cynomologus monkeys, plasma pharmacokinetics and biological activity tested. Cavacini *et al.* [1994b] (**kinetics**)
- F105: Fab fragments show reduced capacity to neutralize IIIB, MN, and RF compared to intact IgG1, suggesting bivalent interaction may be important in binding and neutralization. Cavacini *et al.* [1994a] (**variant cross-recognition or cross-neutralization**)
- F105: A human CD4+ T lymphocyte line was transduced to express Fab fragments of F105 – heavy and light chains are joined by an inter-chain linker – in the transduced cells infected with HIV-1, the Fab binds intracellularly to the envelope protein and inhibits HIV-1 production – secreted Fab fragments neutralize cell-free HIV-1– combined intra- and extracellular binding activities of the expressed Fab make transduced cells resistant to HIV-1 infection and also can protect surrounding lymphocytes by secreting neutralizing antibodies. Chen *et al.* [1994a]; Marasco *et al.* [1993] (**variant cross-recognition or cross-neutralization**)
- F105: MAbs against the glycosphingolipid GalCer block HIV infection of normally susceptible CD4 negative cells from the brain and colon – anti-CD4 MAbs moderately inhibit gp120 binding to GalCer, possibly through steric hindrance – binding of GalCer to gp120 inhibited but did not completely block F105 binding. Cook *et al.* [1994] (**brain/CSF**)
- F105: Used as a positive control for CD4 BS antibodies in a study of the influence of oligomeric structure of Env in determining the repertoire of the Ab response. Earl *et al.* [1994] (**antibody binding site definition and exposure**)
- F105: A mutation in gp41, 582 A/T, confers resistance to neutralization (also confers resistance to MAbs 48d, 21h, 15e and 17b). Thali *et al.* [1994] (**antibody binding site definition and exposure**)
- F105: Additive MN or SF2 neutralization when combined with anti-V3 MAbs 447-52D and 257-D. Cavacini *et al.* [1993a] (**antibody interactions**)
- F105: Serum from all asymptomatic HIV-1 positive people tested block F105 binding, but only from 27% of symptomatic individuals. Cavacini *et al.* [1993b] (**rate of progression**)
- F105: The gp41 mutation 582(Ala to Thr) results in conformational changes in gp120 that confer neutralization resistance to a class of conformation sensitive neutralizing MAbs – required >81 fold higher concentrations to neutralize the mutant than wild type. Klasse *et al.* [1993a] (**antibody interactions**)
- F105: Study of synergy between F105 and sera from vaccinated volunteers with V3-loop specific neutralization activity – 2/3 sera demonstrated neutralization synergy, and 3/3 binding/fusion-inhibition synergy. Montefiori *et al.* [1993] (**antibody interactions**)
- F105: Called F-105 – neutralizes IIIB – strong inhibition of HIV+ human sera binding to IIIB gp120. Moore & Ho [1993]
- F105: Ab response in IIIB lab workers was compared to gp160 LAI vaccine recipients – F105 was used as a control – infected lab workers and some of the gp160 vaccinees had a MAb response that could inhibit gp120-CD4 binding, at lower titers than the infected lab workers. Pincus *et al.* [1993] (**vaccine-specific epitope characteristics**)
- F105: F105 binds to and neutralizes selected lab strains and 3/9 HIV-1 primary isolates – synergistic enhancement of neutralization by seropositive sera. Posner *et al.* [1993] (**antibody interactions**, **variant cross-recognition or cross-neutralization**)
- F105: Study of synergy of neutralization and binding comparing F105 and sCD4 with the V3 MAbs: 50.1, 59.1, 83.1, and 58.2 – synergy was observed, and the data suggest that binding of one ligand (F105) can increase the binding of the second (e. g. V3 loop MAbs) due to conformational changes. Potts *et al.* [1993] (**antibody interactions**)
- F105: A neutralization escape mutant (HXB2 A281V) was selected by growth of HXB2 in the presence of broadly neutralizing sera – F105 neutralization was not affected by this mutation. Watkins *et al.* [1993] (**escape**)
- F105: Binding to Delta V1/2 and Delta V1/2/3 mutant glycoproteins is 2.4- and 13-fold greater, respectively, than binding to wildtype gp120. Wyatt *et al.* [1993] (**antibody binding site definition and exposure**)
- F105: MAb cDNA sequence – V H4 V71-4 rearranged with a D H D-D fusion product of dlr4 and da4, and with J H5 – V kappa is from the Humvk325 germline gene joined with Jkappa 2. Marasco *et al.* [1992] (**antibody sequence variable domain**)
- F105: F105 mediates ADCC against SF2 through the CD16+ population of PBMC – does not mediate complement-dependent cytotoxicity. Posner *et al.* [1992b] (**ADCC**, **complement**)
- F105: Significant enhancement of F105 binding to RF infected cells preincubated with V3-specific MAbs V3-2 and V3-1. Posner *et al.* [1992a] (**antibody interactions**)
- F105: Amino acid substitutions that impair F105 neutralization inhibit gp120-CD4 interaction. Thali *et al.* [1992a] (**antibody binding site definition and exposure**)

B Cell

- F105: Precipitation of Delta 297-329 env glycoprotein, which has a deleted V3 loop, is much more efficient than precipitation of wild type. Wyatt *et al.* [1992] (**antibody binding site definition and exposure**)
- F105: First description of F105, binds topographically near the CD4-binding site – inhibits binding of free, infectious virions to uninfected HT-H9 cells, but does not react with virus adsorbed to uninfected HT-H9 cells – soluble rCD4 prebound to infected cells inhibits F105 binding – F105 inhibits infection of HT-H9 cells in standard neutralization assays with HIV-1 and MN strains. Posner *et al.* [1991] (**antibody binding site definition and exposure**, **antibody generation**)
- F105: F105 neutralization escape mutants result from changes in amino acids in discontinuous regions: C2, 256-262 and C3, 386-370. Thali *et al.* [1991] (**antibody binding site definition and exposure**)

Keywords	antibody binding site definition and exposure, antibody interactions, binding affinity, co-receptor, neutralization, review, subtype comparisons, vaccine antigen design, variant cross-recognition or cross-neutralization

- F91: Molecules designed to eliminate binding by F91 while preserving epitopes of other neutralizing Abs are discussed. Lin & Nara [2007] (**review**)
- F91: This Ab was used to determine the degree to which fixation of gp120 in its CD4-bound conformation restricts antigenic recognition. F91 was not able to bind well to the stabilized gp120. Zhou *et al.* [2007] (**antibody binding site definition and exposure**, **binding affinity**)
- F91: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **review**)
- F91: Ab neutralization of viruses with mixtures of neutralization-sensitive and neutralization-resistant envelope glycoproteins was measured. It was concluded that binding of a single Ab molecule is sufficient to inactivate function of an HIV-1 glycoprotein trimer. The inhibitory effect of the Ab was similar for neutralization-resistant and -sensitive viruses indicating that the major determinant of neutralization potency of an Ab is the efficiency with which it binds to the trimer. It was also indicated that each functional trimer on the virus surface supports HIV-1 entry independently, meaning that every trimer on the viral surface must be bound by an Ab for neutralization of the virus to be achieved. Yang *et al.* [2005c] (**neutralization**)
- F91: A substantial fraction of soluble envelope glycoprotein trimers contained inter-subunit disulfide bonds. Reduction of these disulfide bonds had little effect on binding of the F91 to the glycoprotein indicating that the inter-S-S bonds had no impact on the exposure of F91 epitope. Yuan *et al.* [2005] (**antibody binding site definition and exposure**)
- F91: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- F91: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including F91. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- F91: Alanine scanning mutagenesis was used to compare substitutions that affected anti-CD4BS NAb b12 – rec gp120s were engineered to contain combinations of Alanine substitutions that enhanced b12 binding, and while binding of b12 to these gp120 monomers was generally maintained or increased, binding by five non-neutralizing anti-CD4bs MAbs (b3, b6, F105, 15e, and F91) was reduced or completely abolished. Pantophlet *et al.* [2003a] (**antibody binding site definition and exposure**)
- F91: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- F91: This paper shows that binding of CD4BS MAbs to Env blocks the conformational shift that allows co-receptor CCR5 binding and CD4-independent mediated cell fusion. CD4BS MAbs F105, 15e, and IgG1b12 as well as their Fab fragments inhibited CD4-independent binding of the V1/V2 loop-deleted

B Cell

gp120 glycoproteins of R5 HIV-1 isolates ADA, YU2 and JR-FL and to CCR5 in a concentration dependent manner. CD4BS MAbs IgG1b12, F91 and F105 and their Fab counterparts (except for C11, used as a negative control) inhibited CD4-independent JR-FL and YU-2 gp120-CCR5 binding to CCR5-expressing Cf2Th cells and syncytium formation. Raja *et al.* [2003] (**co-receptor**)

- F91: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
- F91:Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar. Enthalpy and entropy changes were divergent, but compensated. Not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs (17b, 48d, 1.5e, b6, F105 and F91) had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, but the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. The high values suggest surface burial or protein folding an ordering of amino acids. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)
- F91: A series of mutational changes were introduced into the YU2 gp120 that favored different conformations – 375 S/W seems to favor a conformation of gp120 closer to the CD4-bound state, and is readily bound by sCD4 and CD4i MAbs (17b, 48d, 49e, 21c and 23e) but binding of anti-CD4BS MAbs (F105, 15e, IgG1b12, 21h and F91 was markedly reduced – IgG1b12 failed to neutralize this mutant, while neutralization by 2G12 was enhanced – 2F5 did not neutralize either WT or mutant, probably due to polymorphism in the YU2 epitope – another mutant, 423 I/P, disrupted the gp120 bridging sheet, favored a different conformation and did not bind CD4, CCR5, or CD4i antibodies, but did bind to CD4BS MAbs. Xiang *et al.* [2002b] (**antibody binding site definition and exposure**)
- F91: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin – stabilized oligomer gp140 delta683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and C11, A32, and 30D which did not bind the stabilized oligomer. Yang *et al.* [2002] (**antibody binding site definition and exposure**)
- F91: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. Yang *et al.* [2000] (**antibody binding site definition and exposure**)
- F91: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer – CD4BS MAbs 15e, F91 and IgG1b12 bound better to the deleted protein than to wild type. Binley *et al.* [1998] (**antibody binding site definition and exposure**)
- F91: CD4BS MAbs 15e, 21h, and F91 bind with even lower affinity than 205-43-1 and 205-42-15 to JRFL oligomer – conclusions of this paper contrast with Parren *et al.* [1998a] Fouts *et al.* [1998]. Fouts *et al.* [1998]; Parren *et al.* [1998a] (**antibody binding site definition and exposure**)
- F91: Weak inhibition of binding of Hx10 to CD4 positive or negative cells, weakly neutralizing. Mondor *et al.* [1998]
- F91: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a] (**antibody binding site definition and exposure**)
- F91: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – F91 bound monomer, did not bind oligomer or neutralize JRFL. Fouts *et al.* [1997] (**antibody binding site definition and exposure**)
- F91: Unusual pattern of reciprocal enhancement with several anti-V2 and V3 directed MAbs – reciprocal inhibition of other CD4BS MAbs. Moore & Sodroski [1996] (**antibody binding site definition and exposure**, **antibody interactions**)
- F91: Has strong cross-reactivity with gp120 monomers from most subtypes, A-F. Moore *et al.* [1994b] (**subtype comparisons**)
- F91: Called F-91 – neutralizes IIIB – reactive with SF-2 gp120 – strong inhibition of HIV+ human sera binding to IIIB gp120. Moore & Ho [1993] (**variant cross-recognition or cross-neutralization**)

- GP44: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- GP44: GP44 is V H1 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. Wisnewski *et al.* [1996] (**antibody sequence variable domain**)
- GP44: Exhibited a more restricted pattern of neutralizing activity than GP13 and GP68 – the following gp120 amino acid substitutions strongly inhibit binding: 256(S/Y), 257(T/G), 262(N/T), 368(D/R or K), 370(E/R or Q or D) Schutten *et al.* [1993] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)

- GP68: UK Medical Research Council AIDS reagent: ARP3055.
- GP68: Variable domains of three heavy chain Abs, the VHH, were characterized. The Abs were isolated from llamas, who produce immunoglobulins devoid of light chains, immunized with HIV-1 CRF07_BC, to gp120. It was hypothesized that the small size of the VHH, in combination with their protruding CDR3 loops, and their preference for cleft recognition and binding into active sites, may allow for recognition of conserved motifs on gp120 that are occluded from conventional Abs. GP68 was found to compete for binding to recombinant gp120 with the three neutralizing VHH Abs, indicating overlapping epitopes or steric hinderance. Forsman *et al.* [2008] (**binding affinity**)
- GP68: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- GP68: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- GP68: The affect of Ab binding on infectivity was studied by pseudotyping three related envs with different phenotypes – R5 viruses were preferentially enhanced, not X4 – the V3 region was the main determinant of Ab-mediated enhancement and modulation of the interaction between CCR5 and gp120 is critical – tests with MAbs anti-V3 391/95-D and CD4BS-specific GP68 indicate that Ab specificity did not determine whether or not infectivity was enhanced or neutralized, rather the phenotype was determined by Envelope conformation. Guillon *et al.* [2002b] (**enhancing activity**, **variant cross-recognition or cross-neutralization**)
- GP68: GP68 is V H1 – V-region heavy chain usage was examined and a bias of enhanced V H1 and V H4, and reduced V H3, was noted among HIV infected individuals. Wisnewski *et al.* [1996] (**antibody sequence variable domain**)
- GP68: Neutralizes IIIB – only slight inhibition of SI phenotype, and strong enhancement of NSI phenotype chimeric viruses, that incorporated different envs from the same donor. Schutten *et al.* [1995a] (**variant cross-recognition or cross-neutralization**)
- GP68: The gp41 mutation 582(Ala to Thr) results in conformational changes in gp120 that confer neutralization resistance to a class of conformation sensitive neutralizing MAbs – GP68 required markedly higher concentrations to neutralize the mutant than wild type. Klasse *et al.* [1993a] (**antibody binding site definition and exposure**)
- GP68: Neutralized a broad range of HIV-1 lab strains from phylogenetically different subfamilies – the following gp120 amino acid substitutions strongly inhibit binding: 117(K/W), 256(S/Y), 257(T/G), 262(N/T), 368(D/R or K), 370(E/R or Q), 384(Y/E), 435(Y/H) Schutten *et al.* [1993] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)

- 205-43-1 (204-43-4): This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **antibody interactions**, **review**)
- HT5: Also called 205-43-1. This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- HT5: Called 205-43-1: A primary isolate, CC1/85, was passaged 19 times in PBMC and gradually acquired increased sensitivity to FAb b12 and sCD4 that was attributed to changes in the the V1V2 loop region, in particular the loss of a potential glycosylation site. The affinity for sCD4 was unchanged in the monomer, suggesting that the structural impact of the change was manifested at the level of the trimer. The passaged virus, CCcon19, retained an R5 phenotype and its neutralization susceptibility to other Abs was essentially the same as CC1/85. Three CD4BS MAbs, 205-46-9, 205-42-15, and 205-43-1, did not neutralize either the primary or passaged variant. Pugach *et al.* [2004] (**variant cross-recognition or cross-neutralization**, **viral fitness and reversion**)
- HT5: Called 205-43-1 – CD4BS MAbs b12 (neutralizing) and 205-42-15, 204-43-1, 205-46-9 (nonneutralizing) all cross-competed for binding to monomeric gp120, indicating the topological proximity of their epitopes, however, the nonneutralizing CD4BS MAbs did not interfere with the neutralization activity of MAb b12 – the nonneutralizing MAbs partially competed with b12 for Env binding of the surface of Env-transfected cells – this suggests Env has two categories of binding site for CD4BS MAbs, one recognized by both b12 and nonneutralizing CD4BS MAbs, the other is recognized by only b12 – Ab-gp120 interactions based on the use of monomeric gp120 or Env-transfected cells do not predict the outcome of HIV-1 neutralization assays, and they should be interpreted with caution. Herrera *et al.* [2003] (**antibody binding site definition and exposure**, **antibody interactions**)
- HT5: Called 205-43-1: To determine the antigenicity of virus killed by thermal and chemical inactivation, retention of conformation-dependent neutralization epitopes was examined, and exposure of CD4BS epitopes was found to be enhanced (MAbs IgG1b12, 205-46-9, and 205-43-1) – binding to 2G12 and 447-52D epitopes was essentially unaltered – the 17b CD4i epitope was also exposed. Grovit-Ferbas *et al.* [2000] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- HT5: HT5, HT6, and HT7 are also known as 205-43-1, 205-42-15, and 205-46-9, respectively. Rank order of CD4BS antibodies oligomer binding is IgG1b12 = 2G6 = 205-46-9 > 205-43-1 = 205-42-15 > 15e = 21h = F91, and the only thing notably distinguishing about neutralizing IgG1b12 is that it depends on residues in V2. Fouts *et al.* [1998] (**binding affinity**)
- HT5: HT5 and HT6 bind JRSF oligomer but with low affinity, and are not neutralizing – conclusions of this paper contrast with Parren *et al.* [1998a] Fouts *et al.* [1998]. Fouts *et al.* [1998]; Parren *et al.* [1998a] (**antibody binding site definition and exposure**)
- HT5: MAbs IgG1b12, HT5, HT6, and HT7 cross-compete for binding to monomeric gp120, bind equally well, inhibit gp120-sCD4 interactions, but only IgG1b12 neutralizes JRFL. Fouts *et al.* [1997] (**antibody binding site definition and exposure**, **antibody interactions**)
- HT5: Despite highly cross-reactive binding to many primary and T-cell adapted viral strains, only weakly neutralizes IIIB and MN. Moore *et al.* [1995a] (**variant cross-recognition or cross-neutralization**)
- HT5: 205-46-9 was cross-reactive across clades A-F, 205-43-1 very cross-reactive but not quite as extensive 205-46-9. Moore *et al.* [1994b] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)

- 205-46-9: The major infectivity and neutralization differences between a PBMC-derived HIV-1 W61D strain and its T-cell line adapted counterpart were conferred by the interactions of three Env amino acid substitutions, E440G, D457G and H564N. Chimeric Env-pseudotyped virus Ch5, containing all three of the mutations, was more neutralization sensitive to 205-46-9 than Ch2, which did not contain any of these mutations. Neutralization sensitivity to 205-46-9 was somewhat increased in Env-pseudotyped viruses containing individual D457G, E440G, and H564N, or in combinations, compared to viruses lacking these mutations. Binding of 205-46-9 to gp120 derived from Env-pseudotyped viruses was, however, unaffected by any of these mutations. Beddows *et al.* [2005b] (**neutralization**, **binding affinity**)
- 205-46-9: 205-46-9 bound with a similar maximal mean fluorescence intensity (MFI) to Env protein on the surface of cells producing gp140Δct-pseudotyped neutralization sensitive HXBc2 or neutralization resistant 3.2P viruses. Neutralization assays with the pseudotyped viruses showed that HXBc2 was more sensitive to neutralization by 205-46-9 than 3.2P. Furin co-transfection did not have an effect on the reactivity of pseudoviruses with 205-46-9 or on their neutralization sensitivity. Presence or absence of sialic acid residues did not affect Env reactivity with 205-46-9. A cleavage-competent form of 3.2P reacted poorly with 205-46-9, while its cleavage-defective counterpart showed higher level of MAb reactivity. Both cleavage-competent and cleavage-defective HXBc2 showed higher levels of reactivity to 205-46-9. Herrera *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- 205-46-9: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and

importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **antibody interactions**, **review**)

- HT7: Also called 205-46-9. This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this MAb, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- HT7: Called 205-46-9: A primary isolate, CC1/85, was passaged 19 times in PBMC and gradually acquired increased sensitivity to FAb b12 and sCD4 that was attributed to changes in the V1V2 loop region, in particular the loss of a potential glycosylation site. The affinity for sCD4 was unchanged in the monomer, suggesting that the structural impact of the change was manifested at the level of the trimer. The passaged virus, CCcon19, retained an R5 phenotype and its neutralization susceptibility to other Abs was essentially the same as CC1/85. Three CD4BS MAbs, 205-46-9, 205-42-15, and 205-43-1, did not neutralize either the primary or passaged variant. Pugach *et al.* [2004] (**variant cross-recognition or cross-neutralization**, **viral fitness and reversion**)
- HT7: Called 205-46-9 – CD4BS MAbs b12 (neutralizing) and 205-42-15, 204-43-1, 205-46-9 (nonneutralizing) all cross-competed for binding to monomeric gp120, indicating the topological proximity of their epitopes, however, the nonneutralizing CD4BS MAbs did not interfere with the neutralization activity of MAb b12 – the nonneutralizing MAbs partially competed with b12 for Env binding of the surface of Env-transfected cells – this suggests Env has two categories of binding site for CD4BS MAbs, one recognized by both b12 and nonneutralizing CD4BS MAbs, the other is recognized by only b12 – Ab-gp120 interactions based on the use of monomeric gp120 or Env-transfected cells do not predict the outcome of HIV-1 neutralization assays, and they should be interpreted with caution. Herrera *et al.* [2003] (**antibody binding site definition and exposure**)
- HT7: Called 205-46-9. To determine the antigenicity of virus killed by thermal and chemical inactivation, retention of conformation-dependent neutralization epitopes was examined, and exposure of CD4BS epitopes was found to be enhanced (MAbs IgG1b12, 205-46-9, and 205-43-1) – binding to 2G12 and 447-52D epitopes was essentially unaltered – the 17b CD4i epitope was also exposed. Grovit-Ferbas *et al.* [2000] (**antibody binding site definition and exposure**)
- HT7: Called 205-46-9. HT5, HT6, and HT7 are also known as 205-43-1 , 205-42-15, and 205-46-9, respectively. Binds JRSF oligomer with high affinity as does IgG1b12, but IgG1b12 is neutralizing, 205-46-9 is not – conclusions of this paper contrast with Parren98 – authors propose a model where 205-46-9 and 2G6 may inhibit CD4 binding, but cause a conformational shift which enhances CCR5 binding and thus counteracts the neutralizing effect – rank order of CD4BS antibodies oligomer binding is IgG1b12 = 2G6 = 205-46-9 > 205-43-1 = 205-42-15 > 15e = 21h = F91, and the only thing notably distinguishing about neutralizing IgG1b12 is that it depends on residues in V2. Fouts *et al.* [1998] (**assay standardization/improvement**)
- HT7: Binds JRSF oligomer with high affinity, at least as high as IgG1b12, but IgG1b12 is neutralizing, H7 is not – conclusions of this paper contrast with Parren *et al.* [1998a] – authors propose a model where H7 may inhibit CD4 binding, but cause a conformational shift which enhances CCR5 binding and thus counteracts the neutralizing effect Fouts *et al.* [1998]. Fouts *et al.* [1998]; Parren *et al.* [1998a] (**antibody binding site definition and exposure**)
- HT7: MAbs IgG1b12, HT5, HT6, and HT7 cross-compete for binding to monomeric gp120, bind equally well, inhibit gp120-sCD4 interactions, but only IgG1b12 neutralizes JRFL. Fouts *et al.* [1997] (**antibody binding site definition and exposure**)
- HT7: Despite highly cross-reactive binding to many primary and T-cell adapted viral strains, only neutralizes IIIB well, with sporadic weak neutralization of other isolates. Moore *et al.* [1995a] (**variant cross-recognition or cross-neutralization**)
- HT7: 205-46-9 was cross-reactive across clades A-F, 205-43-1 was cross-reactive, but not quite as extensive. Moore *et al.* [1994b] (**subtype comparisons**)

- ICR 39.3b: UK Medical Research Council AIDS reagent: ARP391.
- 39.3: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**vaccine antigen design**, **review**)
- ICR 39.3b: Called 39.3 – summary of the implications of the crystal structure of the core of gp120 bound to CD4 and 17b with what is known about mutations that reduce NAb binding – probable mechanism of neutralization by CD4BS Ab is direct interference with CD4 binding. Wyatt *et al.* [1998]
- ICR 39.3b: Neutralizes only if the antibody is added prior to the attachment of the virus to the cell, in contrast to 39.13g. Armstrong & Dimmock [1996]
- ICR 39.3b: Called 39.3b – increased binding when V1/V2 or V1/V2 and V3 were deleted from gp120. Jeffs *et al.* [1996]
- ICR 39.3b: Kinetics of neutralization studied – no lag for 39.3b, while ICR 39.13g and ICR 41.1i have lags of 5 and 15 min respectively. McLain & Dimmock [1994]
- ICR 39.3b: Conformational, does not bind to denatured IIIB. Moore & Ho [1993]
- ICR 39.3b: Cross-competes with MAbs ICR 39.13g and 15e. Cordell *et al.* [1991]

- Ia3: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This is a novel CD4BS Fab first used in this study. Zwick *et al.* [2003] (**antibody interactions**)

- IgG1b12 database comment: Fab b12 was derived from IgG1b12, Fab 3B3 was derived from Fab b12 by random mutagenesis and selected for increased affinity to sgp120. (**antibody generation**)
- IgG1b12: UK Medical Research Council AIDS reagent: ARP3065.
- IgG1b12: NIH AIDS Research and Reference Reagent Program: 2640.
- b12: Neutralization sensitivity of maternal and infant viruses to b12 close to transmission timepoint was shown to be somewhat better than for 2G12 Ab. The range of sensitivity of maternal viruses to b12 was greater than that of infant viruses. (**neutralization**, **mother-to-infant transmission**)
- IgG1b12: The neutralization activity of this Ab was tested for HIV-1 isolates 92HT593B and NLHX-ADA and compared to the neutralization activity of anti-IgG collected from sera of healthy HIV-uninfected individuals, based on their reactivity with human IgG. For 92HT593B, the neutralization efficacy of IgG1b12 was comparable to that of anti-IgG. (**neutralization**)
- b12: Neutralization susceptibility of CRF01_AE Env-recombinant viruses, derived from blood samples of Thai HIV-1 infected patients in 2006, was tested to b12. Most of the 35 viruses tested replicated efficiently in the presence of b12, indicating that CRF01_AE is not susceptible to neutralization by b12. One of the viruses was highly susceptible to neutralization by b12, and it was shown that the N-terminal regions of gp120, including C1, V1, V2, C2, V3 and most of C3 regions, were responsible for the high susceptibility of this virus to b12. Utachee *et al.* [2009] (**neutralization**, **subtype comparisons**)
- b12: Dose dependent inhibition studies of HIV-1 subtypes A, B, C and D with polyclonal human sera with Abs to gp120, HLA class I or II, and 70kDa heat shock protein (HSP70) showed that combination of three antisera resulted in highest maximum inhibition. The triple Ab HLA-II+HIVgp120+HSP70 combination yielded highest maximum inhibition of subtype B HIV-1 replication of 96.7%, followed by triple HLA-I+gp120+HSP70 combination (92.8% inhibition). Inhibition with mAb b12 was slightly more effective than the inhibition with the polyclonal serum Abs. Babaahmady *et al.* [2008] (**neutralization**)
- b12: 24 broadly neutralizing plasmas from HIV-1 subtype B an C infected individuals were investigated using a series of mapping methods to identify viral epitopes targeted by NAbs. Mutant versions of JR-FL trimers were designed to selectively eliminate neutralization epitopes. Many subtype B plasmas, and few subtype C plasmas, bound more efficiently to the wildtype than to the b12-eliminated mutant, indicating presence of CD4bs NAbs in the plasmas. Binley *et al.* [2008] (**binding affinity**)
- IgG1b12: This study explored features of Env that would enhance exposure of conserved HIV-1 epitopes. The changes in neutralization susceptibility, mediated by two mutations, T569A (in the HR1) and I675V (in the MPER), were unparal-

B Cell

leled in their magnitude and breadth on diverse HIV-1 Env proteins. The variant with both TA and IV mutations was >360-fold more susceptible to 2F5, >180-fold more susceptible to 4E10, 780-fold more susceptible to sCD4 and resulted in 18-fold enhanced susceptibility to autologous plasma and >35-fold enhanced susceptibility to the plasma pool. It was also 2.8-fold more susceptible to b12 but mutants with only one mutations were not neutralized by b12. Blish *et al.* [2008] (**antibody binding site definition and exposure**)

- b12: Three constructs of the outer domain (OD) of gp120 of subtype C, fused with Fc, were generated for immunization of mice: OD(DL3)-Fc (has 29 residues from the centre of the V3 loop removed), OD(2F5)-Fc (has the same deletion reconstructed to contain the sequence of 2F5 epitope), and the parental OD-Fc molecule. Binding of b12 to each of the constructs was found to be negligible. b12 failed to neutralize subtype C CN54 isolate, and was less effective at neutralization of 93MW965.26 isolate than the newly identified OD-specific MAb 2B7, derived by screening of the immunized mice sera. Chen *et al.* [2008a] (**neutralization**, **binding affinity**)
- IgG1b12: The study explores how the V1 loop of Env influences the neutralization susceptibilities of heterologous viruses to antibodies elicited by the SF162gp140 immunogen. All viruses expressing the WT Envs were susceptible to neutralization by IgG1b12. Replacement of the V1 loops by that of SF162 did not alter the neutralization susceptibilities of the viruses, with the exception of one virus, which became more susceptible. Ching *et al.* [2008] (**neutralization**)
- IgG1b12: The goal of the study was to measure NAb responses in patients infected with HIV-1 prevalent subtypes in China. gp160 genes from plasma samples were used to establish a pseudovirus-based neutralization assay. IgG1b12 neutralized 12 of 27 Env-pseudotyped viruses. Chong *et al.* [2008] (**neutralization**, **subtype comparisons**)
- b12: The study compared Ab neutralization against the JR-FL primary isolate and trimer binding affinities judged by native PAGE. There was direct quantitative relationship between monovalent Fab-trimer binding and neutralization, implying that neutralization begins as each trimer is occupied by one Ab. In BN-PAGE, neutralizing Fabs, b12 in particular, and sCD4 were able to shift JR-FL trimers, In contrast, most non-neutralizing Fabs bound to monomer, but their epitopes were conformationally occluded on trimers, confirming the exclusive relationship of trimer binding and neutralization. Crooks *et al.* [2008] (**neutralization**, **binding affinity**)
- b12: Five amino acids in the gp41 N-terminal region that promote gp140 trimerization (I535, Q543, S553, K567 and R588) were considered. Their influence on the function and antigenic properties of JR-FL Env expressed on the surfaces of pseudoviruses and Env-transfected cells was studied. Various non-neutralizing antibodies bind less strongly to the Env mutant, but neutralizing antibody binding is unaffected. There was no difference in b12 binding to wild type and mutant JR-FL, and b12 inhibited infection of the two pseudoviruses with comparable potencies. Dey *et al.* [2008] (**binding affinity**)
- IgG1b12: Envelope determinants that confer natural resistance to b12 were studied. Envelopes from brain tissue (sensitive to b12) and lymph node tissue (resistant to b12) of the same patient were studied. Sensitivity to b12 can be completely modulated by the presence of a glycan at residue 386, although resistance required the presence of an arginine at residue 373. Together, R373 and the N386 glycan may sterically prevent the benzene ring of b12 W100 from penetrating a pocket proximal to these two residues. Nevertheless, b12 bound to monomeric, detergent-solubilized gp120 that carried R373/N386, indicating that the envelope trimer may also play a role in the protection of this epitope. The introduction of R373 into b12-sensitive envelopes rendered both resistant to b12, confirming that this mechanism of b12 resistance transfers to unrelated envelopes. Duenas-Decamp *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **escape**, **structure**)
- b12: Variable domains of three heavy chain Abs, the VHH, were characterized. The Abs were isolated from llamas, who produce immunoglobulins devoid of light chains, immunized with HIV-1 CRF07_BC, to gp120. It was hypothesized that the small size of the VHH, in combination with their protruding CDR3 loops, and their preference for cleft recognition and binding into active sites, may allow for recognition of conserved motifs on gp120 that are occluded from conventional Abs. b12 neutralization and binding activities were compared to the three neutralizing VHH Abs. b12 neutralized 54% of viruses tested, including subtypes B, C, and CRF07_BC, but did not neutralize subtype A, A/G, or D viruses. b12 competed for binding to recombinant gp120 with the three VHH Abs, and inhibited VHH Ab binding to IIIB gp120. Forsman *et al.* [2008] (**neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **subtype comparisons**)
- IgG1b12: Molecular mechanism of neutralization by MPER antibodies, 2F5 and 4E10, was studied using preparations of trimeric HIV-1 Env protein in the prefusion, the prehairpin intermediate and postfusion conformations. MAb IgG1b12 was used to analyze antigenic properties of construct 92UG-gp140-Fd, derived from isolate 92UG037.8 and stabilized by a C-terminal foldon tag. 92UG-gp140-Fd failed to bind IgG1b12 consistent with the resistance of the isolate to neutralization by that MAb, but monomeric gp120 derived from 92UG037 did bind IgG1b12. Frey *et al.* [2008] (**variant cross-recognition or cross-neutralization**, **binding affinity**)
- b12: A series of peptide conjugates were constructed via click reaction of both aryl and alkyl acetylenes with an internally incorporated azidoproline 6 derived from parent peptide RIN-NIPWSEAMM. Many of these conjugates exhibited increase in both affinity for gp120 and inhibition potencies at both the CD4 and coreceptor binding sites. All high affinity peptides inhibited the interactions of YU2 gp120 with b12 Ab. The aromatic, hydrophobic, and steric features in the residue 6 side-chain were found important for the increased affinity and inhibition of the high-affinity peptides. Gopi *et al.* [2008]
- 1b12: This review summarizes the obstacles that stand in the way of making a successful preventive HIV-1 vaccine, such as masked or transiently expressed Ab epitopes, polyclonal B-cell class switching, and inefficient, late, and not sufficiently robust mucosal IgA and IgG responses. Possible reasons why HIV-1 envelope constructs expressing b12 epitope fail to induce broadly neutralizing Abs are discussed. Haynes & Shattock [2008] (**vaccine antigen design**, **review**)
- b12: A mathematical model was developed and used to derive

transmitted or founder Env sequences from individuals with acute HIV-1 subtype B infection. All of the transmitted or early founder Envs were sensitive to neutralization by b12. Keele *et al.* [2008] (**neutralization**, **acute/early infection**)

- b12: Three-dimensional structures of trimeric Env displayed on native HIV-1 in the unligated state and in complex with b12 were compared, using cryo-electron tomography combined with three-dimensional image classification and averaging. Binding of b12 resulted in opening of the trimeric spike, with rotation of each monomer by 20-25 degrees around an axis perpendicular to the viral membrane. Binding of b12 appeared to lock gp120 and trimeric Env in a state that prevents further conformational changes, such as exposure of V3, or rearrangement of gp41. Liu *et al.* [2008] (**antibody binding site definition and exposure**, **structure**)
- b12: A new purification method was developed using a high affinity peptide mimicking CD4 as a ligand in affinity chromatography. This allowed the separation in one step of HIV envelope monomer from cell supernatant and capture of pre-purified trimer. Binding of b12 to gp120SF162 purified by the miniCD4 affinity chromatography and a multistep method was comparable, suggesting that the miniCD4 allows the separation of HIV-1 envelope with intact b12 epitope. gp140DF162ΔV2 was purified by the miniCD4 method to asses its ability to capture gp140 trimers. Purified gp140DF162ΔV2 was recognized by b12, and the k-off value for b12 was reduced compared to gp120SF162 monomer, consistent with the gp140DF162ΔV2 trimeric conformation. Binding of b12 to gp140DF162ΔV2 purified by the miniCD4 affinity chromatography and a multi-step method was comparable, suggesting that the SF162 trimer antigenicity was preserved. Martin *et al.* [2008] (**assay development**, **kinetics**, **binding affinity**)
- b12: Transmission of HIV-1 by immature and mature DCs to CD4+ T lymphocytes was significantly higher for CXCR4- than for CCR5-tropic strains. In contrast to other Abs tested, which lost the capacity to neutralize HIV-1 during capture and transmission by DC-SIGN to T lymphocytes, and which helped in a more efficient transmission of X4 HIV-1 than R5 HIV-1, only b12 efficiently blocked transmission of both virus strains. This indicates that b12, unlike other Abs, cannot be dissociated from HIV-1 following the interaction with DCs. van Montfort *et al.* [2008] (**co-receptor**, **neutralization**, **dendritic cells**)
- IgG b12: Immobilized b12 was able to capture infectious HIV-1 whole virions in a standard virus capture assay, unlike mAbs 8K8 and D5. Addition of soluble CD4 diminished virion capture by b12. Nelson *et al.* [2008]
- IgG1b12: Two HIV-1 isolates, NL4-3 and KB9, were adapted to replicate in cells using the common marmoset receptors CD4 and CXCR4. The adaptation resulted in a small number of changes of env sequences in both isolates. The adapted NL4-3 variants were generally more sensitive to neutralization by b12 than the adapted KB9 variants. All of the NL4-3 exhibited similar sensitivity to neutralization by b12. Wildtype KB9 is resistant to neutralization by b12 but the changes associated with adaptation to marmoset receptors resulted in variants with increased sensitivity to neutralization by b12. Thus, adaptation to marmoset receptors resulted in an increase in sensitivity to neutralization by b12 for KB9 but not for NL4-3. Pacheco *et al.* [2008] (**neutralization**)
- G1b12: Neutralization of HIV-1 IIIB LAV isolate by b12 was within the same range as the neutralization of the virus by natural antibodies from human sera against the gal(α1,3)gal disaccaride linked to CD4 gp120-binding peptides, indicating that the activity of natural antibodies can be re-directed to neutralize HIV-1. Perdomo *et al.* [2008] (**neutralization**)
- b12: The sensitivity of R5 envelopes derived from several patients and sevaral tissue sites, including brain tissue, lymph nodes, blood, and semen, was tested to a range of inhibitors and Abs targeting CD4, CCR5, and various sites on the HIV envelope. All but one envelopes from brain tissue were macrophage-tropic while none of the envelopes from the lymph nodes were macrophage-tropic. Macrophage-tropic envelopes were also less frequent in blood and semen. All but one macrophage-tropic envelopes were sensitive to b12 neutralization, and there was a relationship between increasing macrophage-tropism and increased sensitivity to b12. Peters *et al.* [2008b] (**neutralization**)
- b12: This minireview summarizes data on differences in neutralizing activities of MAbs and pooled human sera using a traditional primary cell neutralization assay and the more standardized TZM-bl reporter cell line assay. Also, suggestions are made on how to improve and standardize neutralization assays for comparable use in different laboratories. b12 neutralization has been shown to correlate well in the two assays (84%), supporting the notion of b12 inhibition of early viral entry steps. In total, however, the assay discordances were shown to be bi-directional and not attributable to assay sensitivity. Polonis *et al.* [2008] (**neutralization**, **review**, **assay standardization/improvement**)
- b12: In order to assess whether small molecule CCR5 inhibitor resistant viruses were more sensitive to neutralization by NAbs, two escape mutant viruses, CC101.19 and D1/85.16, were tested for their sensitivity to neutralization by b12, compared to the sensitivity of CC1/85 parental isolate and the CCcon.19 control isolate. The CC101.19 escape mutant has 4 sequence changes in V3 while the D1/85.16 has no sequence changes in V3 and relies on other sequence changes for its resistance. The two escape mutant viruses were moderately more sensitive to the b12 neutralization than the parental isolate, but not compared to the CCcon.19. Binding of b12 to each of the gp120 proteins was comparable, thus the neutralization sensitivity of the escape mutants may be because alternations in the exposure of the CD4bs on the Env trimer. Overall, the study suggests that CCR5 inhibitor-resistant viruses are likely to be somewhat more sensitive to neutralization than their parental viruses. Pugach *et al.* [2008] (**co-receptor**, **neutralization**, **escape**, **binding affinity**)
- b12: Trimeric envelope glycoproteins with a partial deletion of the V2 loop derived from subtype B SF162 and subtype C TV1 were compared. b12 efficiently recognized subtype B trimers but had negligible reactivity for subtype C trimers. 5 out of 15 amino acid residues involved in b12 binding were shown to differ between the two subtypes. Subtype C trimer had many biophysical, biochemical, and immunological characteristics similar to subtype B trimer, except for a difference in the three binding sites for CD4, which showed cooperativity of CD4

B Cell

binding in subtype C but not in subtype B. Srivastava *et al.* [2008] (**binding affinity**, **subtype comparisons**)

- IgG1b12: The neutralization profile of early R5, intermediate R5X4, and late X4 viruses from a rhesus macaque infected with SHIV-SF162P3N was assessed. The parental R5 virus was resistant to neutralization by IgG1b12, while the R5X4 was neutralization sensitive, and the late X4 virus was the most sensitive to neutralization by IgG1b12 of all. The enhanced neutralization susceptibility of the dual-tropic and the X4 viruses to IgG1b12 suggests adoption of an increasingly open conformation of the Env gp120 over time, with exposure of both the CD4 and co-receptor binding sites. Tasca *et al.* [2008] (**antibody binding site definition and exposure**, **co-receptor**, **neutralization**)
- Ib12: To investigate B-cell responses immediately following HIV-1 transmission, env-specific Ab responses to autologous and consensus Envs in plasma donors were determined. Broadly neutralizing Abs with specificity similar to Ib12 did not appear during the first 40 days after plasma virus detection. Tomaras *et al.* [2008] (**antibody generation**, **acute/early infection**)
- b12: Sera from gp120 DNA prime-protein boost immunized rabbits competed for binding to b12 while sera from rabbits immunized with protein-only regimen did not, indicating elicitation of b12-like Abs in animals immunized with DNA prime-protein boost regimen. Competitive virus capture assay also revealed higher titers of b12 Abs in animals immunized with DNA prime-protein boost than in protein-only immunized animals. Vaine *et al.* [2008] (**vaccine antigen design**)
- b12: A significantly higher level of anti-V3 Ab (694/98D) and anti-C1 mAb (EH21) bound to gp120 complexed with b12 mAb than to gp120 alone or in complex with other non-CD4bs Abs, indicating that binding of b12 to gp120 increases exposure of specific V3 and C1 mAb epitopes. Visciano *et al.* [2008b]
- b12: The membrane-disruptive requirements of the MPER region were investigated using a panel of tryptophan-rich, membrane-disrupting mutants that replace most of the MPER region. The mutants were processed, transported, and expressed on the cell surface, the expression measured by staining of the transfected cells with b12, and being at the levels similar to wildtype, except for the mutants which had truncated cytoplasmic tail and showed elevated levels of staining (>350% of wildtype). Study findings show that the MPER region can accommodate large substitutions and retain fusion activity, and that the MPER conformation is more complex and flexible than simply a stable α-helix, which is important for its insertion into the cell membrane and affects the potency of neutralizing Abs that target this region. However, the sequence modifications in the MPER region resulted in reduced incorporation of Envs into virions, and reduced Env stability. Vishwanathan & Hunter [2008]
- b12: The various effects that neutralizing and non-neutralizing anti-envelope Abs have on HIV infection are reviewed, such as Ab-mediated complement activation and Fc-receptor mediated activities, that both can, through various mechanisms, increase and decrease the infectivity of the virus. The importance of these mechanisms in vaccine design is discussed. The unusual features of the b12 MAb are described, including the importance of its FcR-binding site in protective activity. Willey & Aasa-Chapman [2008] (**review**)
- b12: b12 was tested for its ability to induce conformational changes similar to those induced by CD4. Although presence of sCD4 increased neutralization of JRFL by 447-52D and by immune sera rich in V3-Abs from guinea pigs, the presence of b12 did not, indicating that b12 does not induce a conformation alternation in Env that exposes the V3 loop to neutralizing Abs. Wu *et al.* [2008]
- b12: Current insights into CTLs and NAbs, and their possible protective mechanisms against establishment of persistent HIV/SIV infection are discussed. Pre- and post-infection sterile and non-sterile protection of NAbs against viral challenge, and potential role of NAbs in antibody-mediated antigen presentation in modification of cellular immunity, are reviewed. Use of b12 in immunization experiments and its in vivo antiviral activity in suppression of viral rebound in HIV-1 infected humans undergoing structured treatment interruptions are described. Yamamoto & Matano [2008] (**immunotherapy**, **supervised treatment interruptions (STI)**, **review**)
- b12: The newly detected mAb m44 was shown to neutralize a subtype C SHIV strain more potently than b12. In binding assays, b12 bound to Env at the same levels as m44 but it did not compete with m44 for binding. Zhang *et al.* [2008] (**neutralization**, **binding affinity**)
- b12: HIV-1 neutralization by b12 is briefly reviewed. Albert *et al.* [2007] (**neutralization**)
- b12: Sera from rabbits immunized with either monomeric gp120, trimeric cleavage-defective gp140 or disulfide-stabilized soluble trimeric gp140 were incubated with bead-immobilized gp120 and cyclic V3 where gp120 peptide-beads were previously shown to be able to deplete this Ab from test serum. The HIV-1 JR-FL neutralizing activity of sera from rabbits immunized with the disulfide-stabilized protein was substantially but incompletely reduced, showing that most of the Abs were directed to gp120. Beddows *et al.* [2007] (**neutralization**, **vaccine antigen design**)
- IgG1b12: This Ab was found to be able to bind to a highly stable trimeric rgp140 derived from a HIV-1 subtype D isolate containing intermonomer V3-derived disulfide bonds and lacking gp120/gp41 cleavage. Billington *et al.* [2007]
- b12: Pseudoviruses derived from gp120 env variants that evolved in multiple macaques infected with SHIV 89.6P displayed a range of degrees of virion-associated Env cleavage. Pseudoviruses with higher amount of cleaved Env were more resistant to neutralization by b12. Blay *et al.* [2007] (**neutralization**)
- IgG1b12: Only 1/15 subtype A HIV-1 envelopes from samples taken early in infection was neutralized by b12; the SF162 Env control was neutralized as expected. Blish *et al.* [2007] (**neutralization**, **acute/early infection**, **subtype comparisons**)
- IgG1b12: Yeast display was compared to phage display and shown to select all the scFv identified by phage display and additional novel antibodies. This MAb was used in a competition assays to determine the binding region of the MAbs selected from the yeast displayed antibody library. Bowley *et al.* [2007]

B Cell

- IgG1b12: (R5)X4 viruses obtained early after X4 emergence showed an increased sensitivity to IgG1b12 compared to their coexisting R5 variants. For 3 patients, (R5)X4 viruses obtained late after X4 emergence also showed significantly higher sensitivities to neutralization by IgG1b12 than their co-existing R5 variants. For 2 patients, the differential sensitivity among late viruses was lost due to increased susceptibility of the R5 viruses to IgG1b12. Bunnik *et al.* [2007] (**co-receptor**, **neutralization**)
- IgG1b12: Spread of HIV-1 through formation of virological synapses (VS) between infected and uninfected T-cells was shown to require Env-CD4 receptor interactions. Treatment of the cells with IgG1b12 inhibited 50% of VS-mediated transfer. Chen *et al.* [2007b] (**neutralization**)
- b12: 2 glycosylation site additions to the clade C gp120 backbone (gp120CN54+) were used to reconstruct the 2G12 epitope. Both gp120CN54+ and an Fc tagged gp120CN54 bound to b12 with equal efficiency, suggesting that the Fc tag had no effect on the primary receptor binding conformation. Fc tagged outer domain of gp120CN54+ (ODCN54+-Fc) bound to b12 poorly in spite of the fact that the b12 epitope was shown to lie within the B clade OD. Chen *et al.* [2007a] (**antibody binding site definition and exposure**, **binding affinity**)
- IgG1b12: This MAb was used in a binding competitive assay to approximately localize epitopes for neutralizing MAbs m22, m24 and m46. It competed against m22 and m24 but not m46. Choudhry *et al.* [2007] (**antibody interactions**)
- b12: Most of the sera from guinea pigs immunized with gp120 protein or with three types of VLPs containing disulfide-shackled functional trimers (SOS-VLP), uncleaved nonfunctional Env (UNC-VLP), naked VLP bearing no Env, weakly or ineffectively inhibited virus capture compared to b12 Ab. Sera that contained Abs that enhanced infection, or that were responsible for nonspecific neutralization, did not reverse neutralization by b12. Crooks *et al.* [2007] (**neutralization**)
- b12: b12 had higher affinities for SF162gp140 and ΔV2gp140 than any of the anti-gp41 MAbs detected in this study. Also, b12 bound with faster on-rates, and slower off-rates than the anti-gp41MAbs to these proteins. Differences in neutralization potency could not, however, be explained by the differing kinetics. Derby *et al.* [2007] (**kinetics**, **binding affinity**)
- b12: gp120 proteins with double mutation T257S+S375W, which alters the cavity at the epicenter of the CD4 binding region, bound to b12 slightly less efficiently than wildtype gp120, while the S375W single mutation adversely affected b12 recognition. Viruses harboring the S375W single mutation were threefold less sensitive to neutralization by b12 than viruses with the double mutation T257S+S375W. The ability of rabbit sera to affect binding of CD4 to unmodified gp120 proteins was tested. CD4 binding to gp120 was efficiently blocked by b12. Dey *et al.* [2007b] (**neutralization**, **binding affinity**)
- IgG1b12: SOSIP Env proteins are modified by the introduction of a disulfide bond between gp120 and gp41 (SOS), and an I559P (IP) substitution in gp41, and form trimers. The KNH1144 subtype A virus formed more stable trimers than did the prototype subtype B SOSIP Env, JRFL. The stability of gp140 trimers was increased for JR-FL and Ba-L SOSIP proteins by substituting the five amino acid residues in the N-terminal region of gp41 with corresponding residues from KNH1144 virus. b12, 2G12, 2F5, 4E10 and CD4-IgG2 all bound similarly to the WT and to the stabilized JRFL SOSIP timers, suggesting that the trimer-stabilizing substitutions do not impair the overall antigenic structure of gp140 trimers. Dey *et al.* [2007a] (**therapeutic vaccine**)
- IgG1b12: Polyclonal IgGs from broadly neutralizing sera from two clade B and one clade A infected asymptomatic individuals were able to efficiently inhibit binding of b12 to the WT gp120 but not to the hyperglycosylated mutant gp120, which does not bind conventional nonneutralizing CD4BS Abs but retains binding of b12. This suggests that any CD4BS Abs present in the sera from the three patients responsible for broad neutralization must recognize the CD4BS somewhat differently than b12. This Ab was used to help define the antigenic profile of envelopes used in serum depletion experiments to attempt to define the neutralizing specificities of broadly cross-reactive neutralizing serum; it bound to JR-FL and JR-CSF gp120 monomers and to a lesser extent to core JR-CSF gp120 monomer used in the same experiments. Dhillon *et al.* [2007] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- IgG1b12: Inhibition kinetics experiments with this Ab showed that after 60 min of incubation of virus and cells, with b12 there was nearly 100% infection, indicating that all of the Envs had escaped inhibition by b12 by attaching to CD4 molecules. This was about 20 min earlier then escape of inhibition by 2F5 and 4E10. Dimitrov *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**, **kinetics**)
- b12: A D386N change in the V4 region, which results in restoration of N-glycosylation at this site, resulted in 8-fold increase in resistance of a mutant virus to neutralization by b12 compared to wildtype. Molecular modeling with the HXB2 gp120-b12 crystal indicated that the loss of the glycan at position 386 increases exposure of the CD4 and b12 binding sites. There was a significant association between increased sensitivity to b12 neutralization and enhanced macrophage tropism. Most of the viruses without glycosylation at 386 were sensitive to b12 neutralization, while viruses with glycosylation at this site had variable sensitivity to b12 neutralization. This suggests that increased exposure of b12 epitope is associated with enhanced tropism of HIV for macrophages. Dunfee *et al.* [2007] (**antibody binding site definition and exposure**, **brain/CSF**, **neutralization**)
- IgG1b12: Newborn macaques were challenged orally with the highly pathogenic SHIV89.6P and then treated intravenously with a combination of IgG1b12, 2G12, 2F5 and 4E10 one and 12 hours post-virus exposure. All control animals became highly viremic and developed AIDS. In the group treated with mAbs 1 hour post-virus exposure, 3/4 animals were protected from persistent systemic infection and one was protected from disease. In the group treated with mAbs 12 hour post-virus exposure, one animal was protected from persistent systemic infection and disease was prevented or delayed in two animals. IgG1b12, 2G12, and 4E10 were also given 24 hours after exposure in a separate study; 4/4 treated animals become viremic, but with delayed and lower peak viremia relative to controls. 3/4 treated animals did not get AIDS during the fol-

B Cell

low up period, and 1 showed a delayed progression to AIDS , while the 4 untreated animals died of AIDS. Thus the success of passive immunization with NAbs depends on the time window between virus exposure and the start of immunoprophylaxis. Ferrantelli *et al.* [2007] (**immunoprophylaxis**)

- b12: A synthetic scaffold peptide was designed that mimicked the CD4 binding site of HIV-1 gp120. The peptide was specifically recognized by b12 and competed with gp120 for binding to b12. Anti-sera from rabbits immunized with the peptide competed with b12 for binding to gp120. Franke *et al.* [2007] (**vaccine antigen design**, **binding affinity**)
- 1b12: This review summarizes data on the development of HIV-1 centralized genes (consensus and ancestral) for induction of neutralizing antibody responses. Functionality and conformation of native epitopes in proteins based on the centralized genes was tested and confirmed by binding to 1b12 and other MAbs. Antibodies induced by immunization with these centralized proteins did not, however, have the breadth and potency compared to that of 1b12 and other broadly neutralizing MAbs. 1b12 physical characteristics of autoantibodies as a possible reason for lack of 1b12 broad production is also discussed. Gao *et al.* [2007] (**antibody binding site definition and exposure**, **neutralization**, **review**)
- IgG1b12: Addition of a glycosylation site at position V295N in three different subtype C envelope clones did not have any impact on binding of IgG1b12 to gp120, indicating that the mutation did not cause a substantial conformational change. There were also no significant differences in neutralization by IgG1b12 between the corresponding mutant and the wildtype viruses. Deletion of the glycan at position 386 resulted in >10-fold increase in neutralization sensitivity to IgG1b12 but had no effect on IgG1b12 binding to gp120. Gray *et al.* [2007b] (**neutralization**, **binding affinity**)
- IgG1b12: The binding of b12, 2F5 and 2G12 to the cell-free virus interferes with a step of infection subsequent to cell attachment. HIV escape from b12 ocurred 30 and 10 min before escape from 2F5 for IIIB infection of HeLa cells and JRFL infection of Cf2Th-CD4/CCR5 cells, respectivelly, indicating that neutralization efficiency is determined by the time frames during which Ab can bind to the receptor-activated envelope proteins during the entry phase. b12 cell-free virus neutralization was initiated immediately after expose to the antibody. Haim *et al.* [2007] (**kinetics**)
- Ib12: A recombinant gp120-Fc, used in an assay to determine 2G12 epitope contribution to DC-SIGN binding to gp120, bound to Ib12, indicating it was conformationally intact. Hong *et al.* [2007] (**binding affinity**)
- IgG1b12: The neutralizing activity of this antibody for the JR-FL Env variant with the N160K/E160K mutations was measured in comparison with the neutralizing activity of 2909, which was found to be higher. Honnen *et al.* [2007] (**neutralization**)
- b12: HIV-1 env clones resistant to cyanovirin (CV-N), a carbohydrate binding agent, showed amino acid changes that resulted in deglycosylation of high-mannose type residues in the C2-C4 region of gp120. Compared to their parental virus HIV-1 IIIB, these resistant viruses maintained similar sensitivity to b12, as the glycan at position 301 in the V3 loop was intact. Hu *et al.* [2007] (**neutralization**, **escape**)
- IgG1b12: Binding of IgG1b12 to envelope glycoprotein was significantly increased in the presence of a small molecule HIV-1 entry inhibitor, IC9564, suggesting that the inhibitor changed the conformation of gp120 so that that reacted better with IgG1b12. IC9564 also induces conformational change of gp120 to allow the CD4i antibody 17b to bind, but inhibits CD4-induced gp41 conformational changes. Huang *et al.* [2007b] (**antibody binding site definition and exposure**)
- IgG1b12: This review summarizes current knowledge on the various functional properties of antibodies in HIV-1 infection, including IgG1b12 mAb, in vivo and in vitro activity of neutralizing Abs, the importance and downfalls of non-neutralizing Abs and antibodies that mediate antibody-dependent cellular cytotoxicity and the complement system, and summarizes data on areas tht need future investigation on Ab-mediated immune control. Huber & Trkola [2007] (**review**)
- IgG1b12: IgG1b12: Four consensus B Env constructs: full length gp160, uncleaved gp160, truncated gp145, and N-linked glycosylation-site deleted (gp160-201N/S) were compared. All were packaged into virions, and all but the fusion defective uncleaved version mediated infection using the CCR5 co-receptor. These constructs were sensitive to neutralization by a panel of patient plasma and neutralizing MAbs. The B consensus envelopes were sensitive to neutralization by IgG1b12 except the one with the removed glycosylation site at the base of the V1V2 loop, and an Env derived from a patient during early infection. In contrast, truncation of the gp41 cytoplasmic domain (gp145) yielded the Env that was the most sensitive to IgG1b12. Kothe *et al.* [2007] (**vaccine antigen design**, **variant cross-recognition or cross-neutralization**)
- IgG1b12: Viruses from 304 days and at 643 days (time of death) post-infection of a macaque infected with SHIV SF162P4 were resistant to contemporaneous serum that had broadly reactive NAbs. SF162 was sensitive to neutralization by b12, but the viral isolates evolved to become increasingly resistant. Kraft *et al.* [2007] (**neutralization**, **escape**)
- IgG1b12: This review summarizes b12 Ab epitope, properties and neutralization activity. b12 use in passive immunization studies in primates and possible mechanisms explaining protection against infection are discussed. Also, b12 autoreactivity and its implications for active immunizations are discussed. Kramer *et al.* [2007] (**immunotherapy**, **review**)
- b12: V3 loop deletions were introduced into three different primary HIV-1 strains: R3A, DH12, and TYBE. The deletions included: ΔV3(12,12) containing the first and the last 12 residues of the V3 loop, ΔV3(9,9) containing first and last 9 residues, and ΔV3(6,6) ontaining first and last 6 residues. Only HIV-1 R3A ΔV3(9,9) was able to support cell fusion. Passaging of this virus resulted in a virus strain (TA1) that replicated with wildtype kinetics, and that acquired several adaptive changes in gp120 and gp41 while retaining the V3 loop truncation. TA1 was neutralized by b12 100-fold more efficiently than R3A, ΔV1/V2 virus, and LAI. Laakso *et al.* [2007] (**neutralization**)
- b12: 32 human HIV-1 positive sera neutralized most viruses from clades A, B, and C. Two of the sera stood out as particularly potent and broadly reactive. Two CD4-binding site defective mutant Env proteins were generated to evaluate

B Cell

whether Abs to the CD4-binding site are involved in the neutralizing activity of the two sera. The integrity of the wild-type and mutant proteins was tested to their reactivity to b12. Clade A RW20 and clade B PVO viruses were highly resistant to neutralization by b12, while they were neutralized by IgG eluted from the two patient sera, indicating that novel Abs to the CD4-binding site are elicited in some HIV-1 infected individuals. Li *et al.* [2007b] (**neutralization**, **binding affinity**)

- b12: b12 structure, binding, neutralization, and strategies that can be used for vaccine antigen design to elicit b12-like Abs, are reviewed in detail. Lin & Nara [2007] (**vaccine antigen design**, **review**, **structure**)
- b12: Recombinant monomeric, dimeric and polymeric human monoclonal IgA2 Abs carrying the V regions of MAb b12 were constructed. All three forms of IgA2 reacted with gp120 in a dose-dependent manner with binding affinity, avidity, and reactivity similar to that of IgG1 b12. All three forms of IgA2 inhibited HIVBaL and HIVIIIB infection in PBMCs similarly to IgG1 b12. In T-cell assays, monomeric IgA2 b12 was less effective at neutralizing HIV-1 JR-FL than other b12 forms. All forms of IgA2 b12 were poor at neutralizing HIV-1 JR-CSF, but were slightly more effective in neutralizing HIV-1 HxB2 than IgG1 b12. IgA2 b12 in complex with human secretory component (SC) showed enhanced capacity to block HIV-1 infection of T-cells. Both IgA2 and IgG b12 blocked viral attachment to epithelial cells, and epithelial-PBMC transfer, at similar concentrations. Mantis *et al.* [2007] (**genital and mucosal immunity**, **isotype switch**, **neutralization**, **binding affinity**)
- IgG1b12: This review summarizes data on possible vaccine targets for elicitation of neutralizing Abs and discusses whether it is more practical to design a clade-specific than a clade-generic HIV-1 vaccine. Development of a neutralizing Ab response in HIV-1 infected individuals is reviewed, including data that show no apparent division of different HIV-1 subtypes into clade-related neutralization groups. Also, a summary of the neutralizing activity of mAb IgG1b12 in different HIV-1 clades is provided. McKnight & Aasa-Chapman [2007] (**variant cross-recognition or cross-neutralization**, **review**)
- b12: b12 was able to neutralize the majority of tier 1 and 2 clade B isolates, and two clade C tier 2 isolates. Clade A tier 2 isolates were not neutralized by this Ab. PNGase F treatment, which removes all types of N-linked glycosylation, did not affect binding of b12 to recombinant gp120, nor did it affect neutralizing activity of this Ab. Miranda *et al.* [2007] (**neutralization**)
- b12: Transfer of captured b12-neutralized HIV-1 from Raji-DC-SIGN or immature monocyte-derived DCs (iMDDCs) completely blocked CD4+ T lymphocyte infection. This indicated that unlike other NAbs, such as 2F5 and 4E10, b12-HIV-1 complex is not disassembled upon capture on DC-SIGN-cells. van Montfort *et al.* [2007] (**neutralization**, **dendritic cells**)
- b12: Four different co-receptor switch mutants were generated from ADA and BaL wildtype Envs (ADA-1, ADA-3, BaL-1B, and BaL2A) and the intermediate transition mutations were studied on either CCR5 or CXCR4 expressing cells for their sensitivity to b12 compared to wiltype. Most of the ADA-1 mutants were more sensitive to b12 on CCR5 cells, while the sensitivity varied on CXCR4 cells. Mutations P313R and A221T plus P313R increased resistance to b12. Mutations N197D plus S306R rendered virus highly sensitive to b12 on CCR5 cells but not on CXCR4 cells. The sensitivity of ADA-3 mutants to b12 varied, with mutations N160K, V181, and E322K showing the greatest increase in resistance to b12. BaL-1B mutants were highly sensitive to entry inhibition by b12 on CCR5 cells, which further increased on CXCR4 cells. BaL-2A mutants were also more sensitive to b12 inhibition than the wiltdype virus. Pastore *et al.* [2007] (**co-receptor**, **neutralization**)
- IgG1b12: This review provides information on the HIV-1 glycoprotein properties that make it challenging to target with neutralizing Abs. b12 structure and binding to HIV-1 envelope and current strategies to develop versions of the Env spike with functional trimer properties for elicitation of broadly neutralizing Abs, such as b12, are discussed. In addition, approaches to target cellular molecules, such as CD4, CCR5, CXCR4, and MHC molecules, with therapeutic Abs are reviewed. Phogat *et al.* [2007] (**review**)
- b12: The ability of b12 to neutralize recently transmitted viruses was examined in four homosexual and two parenteral transmission couples. The vast majority of recently transmitted viruses from homosexual recipients were resistant to neutralization by b12, although viruses isolated later in the course of infection showed increased sensitivity to b12 in some of the patients. In the parenteral transmission, both recipient viruses were sensitive to b12 neutralization. The neutralization sensitivity patterns of recipient viruses to b12 did not correlate to the neutralization sensitivity patterns of their donors in the homosexual couples, while the HIV-1 variants from the one of the two parenteral pairs were equally sensitive to neutralization by b12. Quakkelaar *et al.* [2007b] (**neutralization**, **acute/early infection**, **mother-to-infant transmission**)
- b12: The crystal structure of a complex of b12 and B2.1 was determined. This revealed that three contiguos residues mediate critical contacts of B2.1 with b12, and that these are unlikely to mimic the discontinuous key binding residues involved in the full b12 epitope for gp120. This was supported by immunization studies, where immunizations of mice with B2.1 failed to produce gp120 cross-reactive sera. Saphire *et al.* [2007] (**mimotopes**)
- b12: A reference panel of recently transmitted Tier 2 HIV-1 subtype B envelope viruses was developed representing a broad spectrum of genetic diversity and neutralization sensitivity. The panel includes viruses derived from male-to-male, female-to-male, and male-to-female sexual transmissions, and CCR5 as well as CXCR4 using viruses. The envelopes displayed varying degrees of neutralization sensitivity to b12, with 8 of 19 enevlopes sensitive to neutralization by this Ab. The panel was overall less sensitive to neutralization by b12 than previously characterized subtype B envelopes. Schweighardt *et al.* [2007] (**neutralization**, **assay standardization/improvement**)
- b12: Pre-treatment of gp120 with b12 did not inhibit induction of IL-10, indicating that gp120-CD4 interaction is not responsible for IL-10 induction. Shan *et al.* [2007]
- IgG1b12: This Ab was used in the analysis of clade C gp140 (97CN54) antigenicity and was shown to bind with relaively

B Cell

high avidity to the molecule and to dissociate substantially within 420 s. Binding of this Ab to its epitope was not affected significantly by N3C5 or N03B11 Abs. Sheppard *et al.* [2007b] (**antibody interactions**, **binding affinity**)

- b12: Compared to the full-length Con-S gp160, chimeric VLPs containing Con-S ΔCFI gp145 with transmembrane (TM) and cytoplasmic tail (CT) sequences derived from the mouse mammary tumor virus (MMTV), showed higher binding capacity to b12. Chimeric VLPs with only CT derived from MMTV also showed higher binding capacity to b12 than the full-length Con-S gp160, however, not as high as the chimeric CT-TM VLPs. Wang *et al.* [2007a] (**binding affinity**)
- b12: 5145A MAb was used to select phages from two different peptide libraries. Synthetic peptides corresponding to the selected phage sequences fused to phage pIII protein did not bind to b12. Sera from rabbits immunized with 5145A peptide-phage pIII did not inhibit binding of b12 to gp120. Wilkinson *et al.* [2007] (**antibody generation**)
- IgG1b12: Novel approaches based on sequential (SAP) and competitive (CAP) antigen panning methodiologies, and use of antigens with increased exposure of conserved epitopes, for enhanced identification of broadly cross-reactive neutralizing Abs are reviewed. Previously known broadly neutralizing human mAbs are compared to Abs identified by these methods. Zhang & Dimitrov [2007] (**review**)
- b12: This Ab was found to be able to bind well to a form of gp120 stabilized in a CD4-bound state. The structure and interaction of of Ab-gp120 and CD4-gp120 complexes was determined. It was found that the outer domain of gp120 does not require a conformational change for the initial contact with CD4, however, the conformational change is required to lock CD4 into place once contact has been made. In contrast, b12 is able to lock on to gp120 on the outer domain with high affinity without any requirement of conformational change. Only the heavy chain of b12 was found to interact with gp120 outer domain. Zhou *et al.* [2007] (**antibody binding site definition and exposure**, **binding affinity**, **antibody sequence variable domain**, **structure**)
- Fab b12: Fab b12 inhibited binding of Fc-gp120 to cellular CD4. b12 neutralized virus effectively in the standard neutralization assay, however, it was approximately 2.5-fold less active when the virus was pre-incubated with sCD4. Attachment of Fc-gp120 to MDDCs and PBLs was partially inhibited by 2G12, while b12 and sCD4 did not inhibit binding to MDDCs but did inhibit binding to PBLs. The results indicate that Env attachment is mediated through DC-SIGN and other receptors on MDDCs while it is predominantly mediated by CD4 and CCR5 on PBLs. Binley *et al.* [2006] (**neutralization**, **binding affinity**)
- gG1b12: Inhibition of b12 binding to gp120 by b12-like Abs in sera from long-term non-progressors (LTNP) was determined. It was shown that large amounts of b12-like Abs were present in all sera from LTNPs, however, no statistically significant correlation was found for the specificity of this Ab comparing sera able to neutralize all four HIV-1 strains and sera that could not. Braibant *et al.* [2006] (**enhancing activity**, **neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- IgG1b12: Cloned Envs (clades A, B, C, D, F1, CRF01_AE, CRF02_AG, CRF06_cpx and CRF11_cpx) derived from donors either with or without broadly cross-reactive neutralizing antibodies were shown to be of comparable susceptibility to neutralization by IgG1b12. Cham *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- IgG1b12: Neutralization of HIV-1 primary isolates of different HIV-1 clades (A, B, C, D, E) by b12 was determined in cells expressing high or low surface concentrations of CD4 and CCR5 receptors. CD4 and CCR5 cell surface concentration had no significant effect on the inhibitory activity of this Ab. Choudhry *et al.* [2006] (**co-receptor**, **neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- IgG1b12: Neutralization rates and rate constants for the neutralization of clade B primary isolates SF33, SF162 and 89.6 by this Ab were determined. All isolates were neutralized but with different kinetics. It was shown that neutralization sensitivity is not associated with neutralization of cell-associated or free virus. Davis *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **kinetics**)
- b12: Macaques were immunized with SF162gp140, ΔV2gp140, ΔV2ΔV3gp140 and ΔV3gp140 constructs and their antibody responses were compared to the broadly reactive NAb responses in a macaque infected with SHIV SF162P4, and with pooled sera from humans infected with heterologous HIV-1 isolates (HIVIG). b12 bound to SF162gp140 but a deletion of V2 or V3 loops from the gp140 construct reduced the binding. b12 was found to equally neutralize SF162 and Δ2F5.4E10, which is a virus with mutations in the 2F5 and 4E10 epitopes and is resistant to neutralization by 2F5 and 4E10. Sera from the SHIV-infected macaque and HIVIG, that were absorbed with peptides spanning 2F5 and 4E10 epitopes, did not diminish neutralization by IgG1b12. b12-like Abs were not detected in any of the gp140 sera nor in the sera from the infected macaque confirming that b12 epitope exposure does not correlate well with b12 epitope immunogenicity. Derby *et al.* [2006] (**antibody binding site definition and exposure**, **antibody generation**, **neutralization**)
- b12: Inhibition of gp120 interaction with this Ab by a synthesized scaffolded peptide containing three fragments making up the binding site of gp120 for CD4 was determined. The inhibition activity of the three fragments separately was also determined. It was shown that none of the individual peptides were able to inhibit the b12-gp120 interaction but the scaffolded peptide did, indicating a synergistic effect of combining all three fragments in one molecule. Franke *et al.* [2006] (**mimics**)
- IgGb12: This MAb was used as a positive control in the neutralization assays. It neutralized 5 of 5 subtype B and 4 of 6 non-B primary isolates. Gorny *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- gG1b12: Env-pseudotyped viruses were constructed from the gp160 envelope genes from seven children infected with subtype C HIV-1. IgG1b12 neutralized four of the seven viruses and the clade B control. When this Ab was mixed with 2G12

B Cell

and 2F5, the neutralization was similar as to IgGb12 alone, indicating that the majority of the pool activity was due to this Ab. When 4E10 was added to this mix, all isolates were neutralized. Gray *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **responses in children**, **mother-to-infant transmission**)

- IgG1b12: This review describes the effectiveness of the current HIV-1 immunogens in eliciting neutralizing antibody responses to different clades of HIV-1. It also summarizes different evasion and antibody escape mechanisms, as well as the most potent neutralizing MAbs and their properties. MAbs reviewed in this article are: 2G12, IgG1b12, 2F5, 4E10, A32, 447-52D and, briefly, D50. Novel immunogen design strategies are also discussed. Haynes & Montefiori [2006] (**antibody binding site definition and exposure**, **enhancing activity**)
- IgG1b12: Viruses with cleavage-competent 2G12-knockout Env and cleavage-defective Env able to bind 2G12 were constructed. Env pseudotyped virions bearing either Wt3.2P(+)gp140δct Env or a mixture of the wildtype and cleavage-defective Env had similar sensitivities to neutralization by b12. The neutralization by b12 was unaffected by 2G12 binding to uncleaved Env suggesting that only binding to cleavage-competent homotrimers is relevant to neutralization. Herrera *et al.* [2006] (**neutralization**, **binding affinity**)
- IgG1b12: Inhibition of R5 HIV replication by monoclonal and polyclonal IgGs and IgAs in immature monocyte-derived dendritic cells (iMDDCs) was evaluated. It was shown that HIV neutralizing activity of IgG1b12 was more potent in iMDDCs than in PBLs and PHA-stimulated PBMCs using both HIV-1 Bx08 and BaL. Holl *et al.* [2006b] (**neutralization**, **dendritic cells**)
- IgG1b12: The ability of this Ab to inhibit viral growth was increased when macrophages and immature dendritic cells (iDCs) were used as target cells instead of PHA-stimulated PBMCs. It is suggested that inhibition of HIV replication by this Ab for macrophages and iDCs can occur by two distinct mechanisms, neutralization of infectivity involving only the Fab part of the IgG, and, an IgG-FcγR-dependent interaction leading to endocytosis and degradation of HIV particles. Holl *et al.* [2006a] (**dendritic cells**)
- b12: b12 was shown to interact with cells transiently transfected by VSV-gp120 expressing vector and stained with sera from mice immunized once intranasally with VSV vector expressing HIV-1 HXB2 gp120 indicating that VSV-HXB2 immunization produced anti-HIV-1 Abs. Jiang *et al.* [2006] (**vaccine antigen design**)
- IgG1b12: This Ab neutralized 10 of 17 subtype C env-pseudotyped clones derived from individuals in acute/early stage of HIV-1 infection with subtype C. The sensitivity of clones to a mix of Abs IgG1b12, 2G12 and 2F5 was tracked to IgG1b12. Li *et al.* [2006c] (**neutralization**, **variant cross-recognition or cross-neutralization**, **acute/early infection**, **subtype comparisons**)
- IgG1b12: The gp140δCFI protein of CON-S M group consensus protein and gp140CFI and gp140CF proteins of CON6 and WT viruses from HIV-1 subtypes A, B and C were expressed in recombinant vaccinia viruses and tested as immunogens in guinea pigs. IgG1b12 was shown to bind specifically to CON-S, showing that its conformational epitope was intact. Liao *et al.* [2006] (**antibody binding site definition and exposure**, **vaccine antigen design**, **subtype comparisons**)
- IgG1b12: gp41 and p15E of the porcine endogenous retrovirus (PERV) share structural and functional similarities, and epitopes in the membrane proximal region of p15E are able to elicit NAbs upon immunization with soluble p15E. Rabbits immunized with a VSV recombinant expressing an HIV-1 membrane-proximal external region (MPER) fused to PERV p15E, with a fusion p15E-HIV MPER protein boost, elicited HIV specific NAbs. The IgG1b12 MAb was used as a positive control for neutralization in this study. Luo *et al.* [2006] (**vaccine antigen design**)
- b12: In addition to gp120-gp41 trimers, HIV-1 particles were shown to bear nonfunctional gp120-gp41 monomers and gp120-depleted gp41 stumps on their surface. b12 was found to bind to both nonfunctional monomers and to gp120-gp41 trimers. Binding of b12 to trimers correlated with its neutralization of wildtype virus particles. Monomer binding did not correlate with neutralization, but it did correlate with virus capture. It is hypothesized that the nonfunctional monomers on the HIV-1 surface serve to divert the Ab response, helping the virus to avoid neutralization. Moore *et al.* [2006] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- IgG1b12: SHIV SF162p4 virus used as challenge in ISCOM vaccinated macaques was shown to be highly sensitive to neutralization by this Ab. Pahar *et al.* [2006] (**neutralization**)
- b12: The neutralizing capacity and binding of this Ab to gp120, as well as strategies for directing Ab responses to the b12 epitope are reviewed. Pantophlet & Burton [2006] (**antibody binding site definition and exposure**, **neutralization**, **review**, **structure**)
- b12: The crystal structure of this Ab was compared to the high resolution crystal structure of Fab m18. The variable domains sequence similarity of Vh and Vl chains was 46% and 63% respectively, while the hypervariable regions differed significantly. The constant regions were identical. Although the variable regions showed sequence similarity, the H3s of these Abs showed distinct conformations. Prabakaran *et al.* [2006] (**antibody binding site definition and exposure**, **mimics**, **antibody sequence variable domain**, **structure**)
- 12: Binding of b12 to wt gp120 and two constructs with 5 and 9 residues deleted in the middle of the beta3-beta5 loop in the C2 region of gp120 was examined. It was shown that the deletions of the loop residues did not affect the conformation of b12 epitope as b12 Ab binding and kinetics were identical for the wt gp120 and both constructs. Rits-Volloch *et al.* [2006] (**antibody binding site definition and exposure**, **kinetics**, **binding affinity**)
- b12: gp120 (monomer), gp120deltaV2 (trimer), gp140 (monomer) and gp140deltaV2 (trimer) from subtype B SF162 were expressed in cells and their affinity for b12 was assessed. While all four Envs bound to b12, the monomers had at least 3-fold weaker affinity for this Ab than trimers. Sharma *et al.* [2006] (**antibody binding site definition and exposure**)
- 1b12: A fusion protein (FLSC R/T-IgG1) that targets CCR5 was expressed from a synthetic gene linking a single chain gp120-CD4 complex containing an R5 gp120 sequence with

B Cell

the hinge-Ch2-Ch3 portion of human IgG1. The fusion protein did not activate the co-receptor by binding. In PBMC assays, FLSC R/T-IgG1 neutralized primary R5 HIV-1 isolates more potently than 1b12, while in cell-line based assays the neutralization by FLSC R/T-IgG1 was less potent than by 1b12. Vu *et al.* [2006] (**neutralization**)

- IgG1b12: Viruses with wild-type HIV-1JR-FL Envs and HIV-1 hXBc2 Envs were neutralized by this Ab at much lower concentrations than HIV-1 YU2 Env viruses. Viruses bearing inserted artificial epitopes of FLAG in the V4 region were as sensitive to neutralization by this Ab as the parental viruses. A clear relationship between neutralization potency and the affinity of the anti-FLAG antibody for its cognate epitope was observed. Yang *et al.* [2006] (**neutralization**, **binding affinity**)
- IgG1b12: Interactions of this Ab with gp120 monomer and two cleavage-defective gp140 trimers were studied. It was shown that IgG1b12 recognized the soluble monomer less efficiently than the soluble trimers and that treatment of the proteins with GA (cross-linking) minimally decreased their interactions with this Ab, indicating that the IgG1b12 epitope was maintained after cross-linking. This Ab was associated with a small entropy change upon gp120 binding. IgG1b12 also sucsesfully recognized both untreated and cross-linked proteins expressed on cell surfaces indicating existence of multiple conformational states of gp120 on cell surface. This Ab was shown to have a kinetic advantage as it bound to gp120 faster than other less neutralizing Abs. Yuan *et al.* [2006] (**antibody binding site definition and exposure**, **antibody interactions**, **kinetics**, **binding affinity**)
- b12: The major infectivity and neutralization differences between a PBMC-derived HIV-1 W61D strain and its T-cell line adapted counterpart were conferred by the interactions of three Env amino acid substitutions, E440G, D457G and H564N. Chimeric Env-pseudotyped virus Ch5, containing all three of the mutations, was equally neutralization sensitive to b12 as Ch2, which did not contain any of these mutations. Env-pseudotyped viruses containing D457G mutation were markedly resistant to neutralization by b12. Also, binding of b12 to any gp120 that contained this mutation was severely disrupted. Beddows *et al.* [2005b] (**neutralization**, **binding affinity**)
- IgG1b12: A panel of 60 HIV-1 isolates, with complete genome sequences available, was formed for neutralization assay standardization. It comprises of 10 isolates from each of the subtypes A, B, C, D, CRF01_AE and CRF02AG, with majority of the viruses being of R5 phenotype and few of X4 phenotype. Neutralization profile of each isolate was assessed by measuring neutralization by sCD4, a cocktail of MAbs including 2G12, 2F5 and IgG1b12, and a large pool of sera collected from HIV-1 positive patients. The MAb cocktail neutralized with >50% a large portion of the isolates (51/60) including: 10 subtype A isolates, 8 subtype B isolates, 8 subtype C isolates, 9 subtype D isolates, 7 CRF-01_AE isolates, and 9 CRF_02AG isolates. Brown *et al.* [2005] (**neutralization**, **subtype comparisons**, **assay standardization/improvement**)
- b12: Four primary isolates (PIs), Bx08, Bx17, 11105C and Kon, were tested for binding and neutralization by b12. b12 was able to neutralize Bx08, Bx17 and 11105C with various efficiencies, but bound poorly to all four PIs with similar efficiencies. There was no direct correlation between binding and neutralization of the four PIs by b12. Burrer *et al.* [2005] (**neutralization**, **binding affinity**)
- b12: The structure of the b12 MAb, particularly its long CDRH3 region, is reviewed. Also, the mechanism of its binding to the CD4 binding site of gp120 is compared to other CD4bs MAbs with no neutralizing activity. Engineering of Abs based on revealed structures of broadly neutralizing MAbs is discussed. Burton *et al.* [2005] (**antibody binding site definition and exposure**, **review**, **structure**)
- IgG1b12: The lack of glycosylation sites at residues Asn 295 and Thy 394 within C-clade gp120s generally causes the loss of 2G12 recognition. Introduction of glycans in the subtype C strain HIV-1CN54 at these positions restored 2G12 binding, and addition of just a single glycan partially restored binding (V295N + A394T » V295N > A395T). 2G12 epitope recovery decreased b12 binding. Chen *et al.* [2005]
- b12: b12 was investigated in differnt neutralization formats, including the standard format that measures activity over the entire infection period and several formats that emphasize various stages of infection. The neutralization by b12 was most potent in the standard format and somewhat less potent in the post-CD4 format and the pre-attachment format. The post-CD4/CCR5 neutralization format strongly disfavored b12 neutralization. This suggests that the optimum target for b12 is the native unliganded trimer. HIV-1 + human plasma mediated high-levels of post-CD4 neutralization indicating presence of b12 and 2G12 -like Abs. Crooks *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **assay standardization/improvement**)
- IgG1b12: A phage peptide library was panned on immobilized IgG1b12 which lead to identification of a mimotope consensus sequence for IgG1b12 binding. Second and third generation libraries were used to identify a refined consensus sequence (GLLVWSDEL). The IgG1b12 mimotopes competed with gp160 for the IgG1b12 antigen-binding site. Mice immunized with mimotopes from all three phage library generations developed weak immune responses towards gp160, however, mice vaccinated with the clone from the third library generation exhibited on average stronger gp160-specific Ab response than mice vaccinated with first and second generation clones. Sera of immunized mice were reactive against five different unrelated HIV-1 strains. Dorgham *et al.* [2005] (**mimotopes**, **vaccine antigen design**, **binding affinity**)
- IgG1b12: rSFV-gp140(-GCN4) was constructed for analysis of its immunogenic properties in animal models. Both gp120 and gp140(-GCN4) secreted from rSFV-infected cells were recognized by IgG1b12, suggesting that the proteins retained their native folding. Forsell *et al.* [2005] (**antibody binding site definition and exposure**)
- IgG1b12: Monomeric gp120 and trimeric gp140CF proteins synthesized from an artificial group M consensus Env gene (CON6) bound well to IgG1b12, indicating correct exposure of the IgG1b12 epitope. Gao *et al.* [2005a] (**antibody binding site definition and exposure**)
- IgG1b12: 2909 is a human anti-Env NAb that was selected by neutralization assay and binds to the quaternary structure on

B Cell

the intact virion. ELISA-based competition assays and subsequent mutational analysis determined that the CD4BS and V2 and V3 loops contribute to the 2909 epitope: 2909 binding was inhibited by MAbs 447-52d (anti-V3), 830A (anti-V2), and IgG1b12 (anti-CD4BS) and sCD4. 2909 was not inhibited by MAbs 670, 1418, nor 2G12. Gorny *et al.* [2005]

- IgG1b12: IgG1b12, like the other anti-Env broadly neutralizing MAbs 2F5 and 4E10, binds to auto-antigens and has characteristics of polyspecific autoreactive antibodies. Of 35 Env-specific MAbs tested, only 2F5, 4E10, IgG1b12, and two CD4BS adjacent MAbs (A32 and 1.4G) and gp41 MAbs (2.2B and KU32) had binding patterns suggesting polyspecific autoreactivity, and similar reactivities may be difficult to induce with vaccines because of elimination of such autoreactivity. IgG1B12 reacted with ribonucleoprotein, dsDNA, centromere B, and histones, as well as nucleolar and cytoplasmic reactivity in HEp-2 cells. Haynes *et al.* [2005a]
- IgG1b12: This review summarizes data on the polyspecific reactivities to host antigens by the broadly neutralizing MAbs IgG1b12, 2G12, 2F5 and 4E10. It also hypothesizes that some broadly reactive Abs might not be routinely made because they are derived from B cell populations that frequently make polyspecific Abs and are thus subjected to B cell negative selection. Haynes *et al.* [2005b] (**antibody generation**, **antibody interactions**, **review**)
- IgG1b12: b12 and the gp41 C-terminal binding MAb SAR1 inhibit HIV-1 infected cell fusion with target cells at comparable levels. Heap *et al.* [2005a]
- b12: b12 bound with a higher maximal mean fluorescence intensity (MFI) to Env protein on the surface of cells producing gp140Δct-pseudotyped neutralization resistant 3.2P strain, than to the Env of pseudotyped neutralization sensitive HXBc2. Neutralization assays with the pseudotyped viruses showed that HXBc2 was more sensitive to neutralization by b12 than 3.2P. Furin co-transfection did not have an effect on the reactivity of pseudoviruses with b12 or on their neutralization sensitivity. Presence or absence of sialic acid residues did not affect Env reactivity with b12. A cleavage-competent form of 3.2P reacted poorly with b12, while its cleavage-defective counterpart showed higher level of MAb reactivity. Both cleavage-competent and cleavage-defective HXBc2 showed higher levels of reactivity to b12. Herrera *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- igG1b12: Point mutations in the highly conserved structural motif LLP-2 within the intracytoplasmic tail of gp41 resulted in conformational alternations of both gp41 and gp120. The alternations did not affect virus CD4 binding, coreceptor binding site exposure, or infectivity of the virus, but did result in increased relative neutralization resistance of the LLP-2 mutant virus to IgG1b12, compared with wildtype virus. The increased neutralization resistance of LLP-2 virus was associated with decreased IgG1b12 binding to its epitope. Kalia *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- b12: A series of genetically modified Env proteins were generated and expressed in both insect and animal cells to be monitored for their antigenic characteristics. For b12, three of the modified proteins expressed in insect cells, including 3G mutant (mutations in 3 glycosylation sites), dV1V2 mutant (V1V2 deletions), and 3G-dV2-1G mutant (1G being a mutation near the TM domain), showed higher binding than the wildtype. Only one of those modified proteins, 3G, now expressed in animal cells, showed higher binding to b12 than the wildtype, indicating that neutralizing epitopes may be more highly exposed in this Env structure. 3G-dV2-1G highly increased binding of b12 compared to 3G-dV2, indicating that glycans in gp41 play a role in the Env antigenicity. Kang *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)
- IgG1b12: A trimeric recombinant gp140 construct was developed for immunization studies. Its structural integrity was assessed by a panel of MAbs. The trimeric gp140 was recognized by IgG1b12 in a manner comparable to monomeric gp120, suggesting that IgG1b12 epitope was well presented on the construct. Kim *et al.* [2005] (**antibody binding site definition and exposure**)
- IgG1b12: Sera from subtype A infected individuals from Cameroon have antibodies that react strongly with subtype A and subtype B V3 loops in fusion proteins, and neutralize SF162 pseudotypes, while sera from 47 subtype B infected individuals reacted only with subtype B V3s. Sera from Cameroon did not neutralize primary A or B isolates, due to indirect masking by the V1/V2 domain rather than due to loss of the target epitope. Neutralization by Cameroonian sera MAbs was blocked by Clade A and B V3 loop fusion proteins, while NAbs to non-V3 epitopes, 2F5, 2G12, and b12, were not blocked. Krachmarov *et al.* [2005]
- IgG1b12: Full-length gp160 clones were derived from acute and early human HIV-1 infections and used as env-pseudotyped viruses in neutralization assays for their characterization as neutralization reference agents. The broadest neutralization sensitivity was observed for IgG1b12, where 12 out of 19 pseudoviruses were neutralized. The sensitivity was however even higher for MN, SF162.LS and IIIB strains. A mixture of IgG1b12, 2F5 and 2G12 (TriMab) exhibited potent neutralizing activity against all Env-pseudotyped viruses except one. 6 out of 12 Env-pseudotyped viruses were more sensitive to neutralization by IgG1b12 than their uncloned parental PBMC-grown viruses. Li *et al.* [2005a] (**neutralization**, **assay standardization/improvement**)
- b12: Pseudoviruses expressing HIV-1 envelope glycoproteins from BL01, BR07 and 89.6 strains were compared in neutralization assays to replication competent clone derived from transfection of 293T cells (IMC-293T) and to the IMC-293T derived from a single passage through PBMC (IMC-PBMC). The neutralization responses of pseudoviruses and corresponding IMC-293T to b12 were similar, while a significant decrease in viral neutralization sensitivity to b12 was observed for the BL01 and 89.6 IMC-PBMC viruses. The decrease was associated with an increase in average virion envelope glycoprotein content on the PBMC-derved virus. Louder *et al.* [2005] (**neutralization**, **assay standardization/improvement**)
- IgG1b12: Called IgG1 b12. The HIV-1 Bori-15 variant was adapted from the Bori isolate for replication microglial cells. Bori-15 had increased replication in microglial cells and a robust syncytium-forming phenotype, ability to use low levels

of CD4 for infection, and increased sensitivity to neutralization by sCD4 and 17b. Four amino acid changes in gp120 V1-V2 were responsible for this change. Protein functionality and integrity of soluble, monomeric gp120-molecules derived from parental HIV-1 Bori and microglia-adapted HIV-1 Bori-15 was assessed in ELISA binding assays using CD4BS MAbs F105 and IgG1b12, glycan-specific 2G12, and V3-specific 447-52D, and were unchanged. Association rates of sCD4 and 17b were not changed, but dissociation rates were 3-fold slower for sCD4 and 14-fold slower for 17b. Martín-García *et al.* [2005]

- IgG1b12: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**, **variant cross-recognition or cross-neutralization**, **immunotherapy**, **review**, **structure**)
- IgG1b12: Viruses containing substitutions at either L568 or K574 of the gp41 hydrophobic pocket were resistant to D5-IgG1 but were as sensitive to IgG1b12 as the wildtype virus. IgG1b12 neutralized more isolates than D5-IgG1 and was shown to be more potent. IgG1b12 did not, however, neutralize some of the isolates neutralized by D5-IgG1. Miller *et al.* [2005] (**neutralization**)
- IgG1b12: This short review summarizes recent findings of the role of neutralizing Abs in controlling HIV-1 infection. Certain neutralizing MAbs and their potential role in immunotherapy and vaccination, as well as the reasons for their poor immunogenicity, are discussed. Montefiori [2005] (**antibody binding site definition and exposure**, **therapeutic vaccine**, **immunotherapy**)
- IgG1b12: IgG1b12 neutralized both JR-FL and YU2 HIV-1 strains. IgGb12 and other neutralizing mAbs recognized JR-FL cleavage-competent and cleavage-defective env glycoproteins, while non-neutralizing Abs only recognized JR-FL cleavage-defective glycoproteins. It is suggested that an inefficient env glycoprotein precursor cleavage exposes non-neutralizing determinants, while only neutralizing regions remain accessible on efficiently cleaved spikes. For YU2, both cleavage-competent and -defective glycoproteins were recognized by both neutralizing and non-neutralizing Abs. Pancera & Wyatt [2005] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- IgG1b12: A stable trimerization motif, GCN4, was appended to the C terminus of YU2gp120 to obtain stable gp120 trimers (gp120-GCN4). Each trimer subunit was capable of binding IgG1b12, indicating that they were at least 85% active. D457V mutation in the CD4 binding site resulted in a decreased affinity of the gp120-GCN4 for CD4, but the mutation did not affect binding of IgG1b12. IgG1b12 was able to bind to both wildtype gp120, gp120-GCN4, and to the respective corresponding mutant molecules D457Vgp120 and D457Vgp120-GCN4. Electron microscopy images showed three, two and one IgG1b12 molecules bound per gp120-GCN4 trimer, with the predominant form being three IgG1b12 per trimer. Pancera *et al.* [2005] (**binding affinity**, **structure**)
- IgG1b12: This study is about the V2 MAb C108g, that is type-specific and neutralizes BaL and HXB2. JR-FL is a neutralization resistant strain; modification of JRFL at V2 positions 167 and 168 (GK->DE) created a C108g epitope, and C108g could potently neutralize the modified JR-FL. The modification in V2 also increased neutralization sensitivity to V3 MABs 4117c, 2219, 2191, and 447-52D, but only had minor effects on neutralization by CD4BS MAb 5145A, and broadly neutralizing MAbs IgG1b12, 2G12, and 2F5. gp120 binding to CD4 was inhibited by b12, but not by C108g. Pinter *et al.* [2005]
- IgG1b12: Retrovirus inactivation for vaccine antigen delivery was explored through lipid modification by hydrophobic photoinduced alkylating probe 1.5 iodonaphthylazide (INA). The viral proteins were shown to be structurally intact in the treated non-infectious virus, through the preservation of antibody binding sites for polyclonal anti-gp120 serum, and for broadly neutralizing MAbs 2G12, b12 and 4E10, although the modifications of the lipid disabled viral infection. Raviv *et al.* [2005] (**vaccine antigen design**)
- IgG1b12: Escape mutations in HR1 of gp41 that confer resistance to Enfuvirtide reduced infection and fusion efficiency and also delayed fusion kinetics of HIV-1. The mutations also conferred increased neutralization sensitivity of virus to IgG1b12. Enhanced neutralization correlated with reduced fusion kinetics, indicating that the mutations result in Env proteins remaining in the CD4-triggered state for a longer period of time. Reeves *et al.* [2005] (**antibody binding site definition and exposure**, **drug resistance**, **neutralization**, **escape**, **HAART, ART**)
- IgG1b12: The antibody M2 is specific for a peptide flag inserted into the V4 loop of YU-2, a neutralization resistant variant with a short V4 loop. IgG1b12 and 2F5 could neutralize both the WT YU-2 and the modified variant. The high diversity of V4 suggests it does not play a direct role in receptor binding or viral entry, yet M2, specific for the peptide insert tag, can neutralize the modified virus, demonstrating that neutralizing activity doesn't have to block functionality of the virus. Ren *et al.* [2005] (**neutralization**)
- IgG1b12: 24 out of 58 virus isolates from acutely and chronically HIV-1 infected patients were not inhibited by IgG1b12. There was, however, no difference between the acute and chronic patient viruses in their sensitivity to this Ab. There was no correlation between sensitivities to IgG1b12 and CCR5 inhibitors. Rusert *et al.* [2005] (**autologous responses**, **neutralization**, **acute/early infection**)
- IgG1b12: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies in vaccinated rabbits, but GDMR elicited anti-V3 NAbs. Both antigens successfully dampened other responses that were intended to be

B Cell

dampened while not obscuring b12 binding. CD4BS MAbs except Fab b12 (b6, b3, F105) did not bind to either GDMR or mCHO. CD4i MAbs (48d, 17b) did not bind even with sCD4. 2G12 had diminished binding to both. V3 MAbs (447-52D, 19b, F245-B4e8 and 39F) bound to the GDMR antigen, but either did not bind or had diminished binding to mCHO. V2 MAb 697-D did not bind to mCHO and had diminished binding to GDMR, while V2 MAb 8.22.2 bound to GDMR but not mCHO. V1/V2/V3 MAb 4KG2, C1-C4 MAb A32, C1-C5 MAb C11, and HIVIG all either did not bind or had significantly diminished binding to both antigen constructs. Selvarajah *et al.* [2005] (**vaccine antigen design**, **vaccine-specific epitope characteristics**)

- b12: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**, **binding affinity**, **immunotherapy**, **review**)
- b12: This review summarizes data on 447-52D and 2219 crystallographic structures when bound to V3 peptides and their corresponding neutralization capabilities. b12, like 447-52D and like other HIV-1 neutralizing Abs, was shown to have long CDR H3 loop, which is suggested to help Abs access recessed binding sites on the virus. Stanfield & Wilson [2005] (**antibody binding site definition and exposure**, **review**, **structure**)
- IgG1b12: This Ab bound with high affinity to gp120IIIb but it only weakly suppressed gp120 antigen presentation by MHC class II. Binding of b12 to gp120 did not prevent uptake of gp120 by APCs. b12 showed intermediate disassociation from gp120 at acidic pH. Lysosomal enzyme digestion of gp120 in complex with b12 yielded limited fragmentation similar to that of gp120 alone. It is suggested that neutralizing high-affinity CD4bs Abs, such as b12, provide effective anti-viral protection without strong supressive effects on presentation of gp120. Tuen *et al.* [2005] (**antibody interactions**, **binding affinity**)
- IgG1b12: The crystal structure of the Fab fragment from F105 was solved. It has an extended CDR H3 loop, with a Phe at the apex that may recognize the binding pocket of gp120 used by the Phe-42 residue of CD4. The potent NAB IgG1b12 recognizes an overlapping binding site, the main difference is that F105 extends across the interface of the inner and outer domains of gp120 while b12 does not. IgG1b12 also has undergone extensive affinity maturation (45 mutations) while F105 has not (13 mutations) – an average for gp120 MAbs is 22 mutations. Wilkinson *et al.* [2005] (**antibody sequence variable domain**, **structure**)
- b12: Ab neutralization of viruses with mixtures of neutralization-sensitive and neutralization-resistant envelope glycoproteins was measured. It was concluded that binding of a single Ab molecule is sufficient to inactivate function of an HIV-1 glycoprotein trimer. The inhibitory effect of the Ab was similar for neutralization-resistant and -sensitive viruses indicating that the major determinant of neutralization potency of an Ab is the efficiency with which it binds to the trimer. It was also indicated that each functional trimer on the virus surface supports HIV-1 entry independently, meaning that every trimer on the viral surface must be bound by an Ab for neutralization of the virus to be achieved. Yang *et al.* [2005c] (**neutralization**)
- IgG1b12: A substantial fraction of soluble envelope glycoprotein trimers contained inter-subunit disulfide bonds. Reduction of these disulfide bonds had little effect on binding of the IgG1b12 to the glycoprotein indicating that the inter-S-S bonds had no impact on the exposure of IgG1b12 epitope. Yuan *et al.* [2005] (**antibody binding site definition and exposure**)
- IgG1b12: HIV-1 fusion complexes were prepared from cell lines expressing R5 HIV-1 gp120/gp41 and CD4-CCR5. Neutralizing Abs were raised against both R5 (strain BaL) and X4 (strain 213) viruses. IgG1b12 was used to detect gp120/gp41. Zipeto *et al.* [2005] (**vaccine antigen design**)
- IgG1b12: This review summarizes data that indicate that the V3 region of HIV-1 may be an epitope to target for the induction of protective Abs. Data shows that the V3 region can induce broadly-reactive, cross-neutralizing Abs, that it is partially exposed during various stages of the infectious process, and that it is immunogenic. IgG1b12 is the only neutralizing anti-CD4bs MAb, suggesting that the CD4bs is not an epitope that preferentially induces protective Abs in spite of it being highly immunogenic. Zolla-Pazner [2005] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **review**)
- IgG1b12: 93 viruses from different clades were tested for their neutralization cross-reactivity using a panel of HIV antibodies. IgG1b12 neutralized a fraction of viruses from almost every clade, and was more potent that 2F5 and 4E10, particularly against a subset of B clade viruses. Binley *et al.* [2004] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- IgG1b12: Called b12. The peptide 12p1 (RINNIPWSEAMM) inhibits direct binding of YU2 gp120 or Env trimer to CD4, CCR5 and MAb 17b in a concentration-dependent allosteric manner. 12p1 is thought to bind to unbound gp120 near the CD4 binding site, with a 1:1 stoichiometry. 12p1 also inhibited MAb F105 binding. presumably because F105 favors an unactivated conformation, but not 2G12 or b12. The 1:1 stoichiomtry, the fact that the peptide binding site is accessible on the trimer, the non-CD4 like aspect of the binding, and an ability to inhibit viral infection in cell cultures make it a promising lead for therapeutic design. Biorn *et al.* [2004] (**antibody binding site definition and exposure**)
- IgG1b12: Env sequences were derived from 4 men at primary infection and 4 years later; the antigenicity in terms of the ability to bind to 2G12, 2F5 and IgG1b12 was determined. 2G12 bound primarily to late clones in 3 of the 4 patients, and to both early and late in the other patient. Neither 2F5 nor IgG1b12 showed a difference in binding affinity to early or late envelopes. Dacheux *et al.* [2004]
- IgG1b12: Nabs against HIV-1 M group isolates were tested for their ability to neutralize 6 randomly selected HIV-1 O group strains. IgG1b12 could neutralize some O group strains

B Cell

when used on its own, and quadruple combination of b12, 2F5, 2G12, and 4E10, could neutralize the six Group O viruses tested between 62-97%. Ferrantelli *et al.* [2004a]

- IgG1b12: Called b12. A set of oligomeric envelope proteins were made from six primary isolates for potenial use as vaccine antigens: 92/UG/037 (clade A), HAN2/2 (clade B), 92/BR25/025 (clade C), 92/UG/021 (clade D), 93/BR/029 (clade F) and MVP5180 (clade O). This was one of a panel of MAbs used to explore folding and exposure of well characterized epitopes. The clade C isolate BR25 is apparently misfolded, as conformation-dependent antibodies did not bind to it. b12 bound to clade A, B, D and F HIV-1 primary isolates. Polyclonal sera raised in rabbits against these antigens cross-bound the other antigens, but none of the sera had neutralizing activity. Jeffs *et al.* [2004] (**variant cross-recognition or cross-neutralization**)
- IgG1b12: Sera from two HIV+ people and a panel of MAbs were used to explore susceptibility to neutralization in the presence or absence of glycans within or adjacent to the V3 loop and within the C2, C4 and V5 regions of HIV-1 SF162 env gp120. The loss of the any of the five glycans, within the V3 loop (GM299 V3), C2 (GM292 C2), C3 (GM329 C3), C4 (GM438 C4), or V5 (GM454 V5) made SF162 become more sensitive to IgG1b12 neutralization. V3 glycans tended to shield V3 loop, CD4 and co-receptor MAb binding sites, while C4 and V5 glycans shielded V3 loop, CD4, gp41 but not co-receptor MAb binding sites. Selective removal of glycans from a vaccine candidate may enable greater access to neutralization susceptible epitopes. McCaffrey *et al.* [2004] (**antibody binding site definition and exposure**)
- IgG1b12: Fab b12. A set of HIV-1 chimeras that altered V3 net charge and glycosylation patterns in V1V2 and V3, involving inserting V1V2 loops from a late stage primary isolate taken after the R5 to X4 switch, were studied with regard to phenotype, co-receptor usage, and MAb neutralization. The loops were cloned into a HXB2 envelope with a LAI viral backbone. It was observed that the addition of the late-stage isolate V1V2 region and the loss of V3-linked glycosylation site in the context of high positive charge gave an X4 phenotype. R5X4 viruses were more sCD4 and 2G12 neutralization resistant than either R5 or X4, but the opposite pattern was observed for b12. Addition of the late stage V1V2 altered neutralization for both MAbs, but this alteration was reversed with the loss of the V3 glycan. Nabatov *et al.* [2004] (**co-receptor**)
- IgG1b12: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it binds to the neutralizing MAb 2G12. It masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120. Pantophlet *et al.* [2004]
- IgG1b12: Called IgG-b12. V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neturalization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12 which neutralized both strains), neutralized the SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype. Three anti-CD4BS MAbs were tested, including IgG1b12 which neutralizes both JRFL and SF162. The affinities for IgG1b12 and 5145A were similar for both JRFL and SF612, but 1125A bound with 2.5 fold higher affinity to SF162. 5145A and 1125H both preferentially neutralize SF162, but not JRFL, and the CD4BS is more sensitive to neutralization in the context of the SF162 V1V2 loop. This was also true for neutralization by sCD4. Pinter *et al.* [2004] (**variant cross-recognition or cross-neutralization**)
- IgG1b12: Called b12. A primary isolate, CC1/85, was passaged 19 times in PBMC and gradually acquired increased sensitivity to FAb b12 and sCD4 that was attributed to changes in the V1V2 loop region, in particular the loss of a potential glycosylation site. The affinity for sCD4 was unchanged in the monomer, suggesting that the structural impact of the change was manifested at the level of the trimer. The passaged virus, CCcon19, retained an R5 phenotype and its neutralization susceptibility to other Abs was essentially the same as CC1/85. CCcon19 (IC50 0.3) was significantly more senstivie to neutralization by b12 than was CC1/85 (IC50 6.0). Pugach *et al.* [2004]
- IgG1b12: This review discusses research presented at the Ghent Workshop of prevention of breast milk transmission and immunoprophylaxis for HIV-1 in pediatrics (Seattle, Oct. 2002), and makes the case for developing passive or active immunoprophylaxis in neonates to prevent mother-to-infant transmission. Macaque studies have shown that passive transfer of NAb combinations (for example, IgG1b12, 2G12, 2F5, and 4E10) can confer partial or complete protection to infant macaques from subsequent oral SHIV challenge. Safrit *et al.* [2004]
- IgG1b12: Called IgG1 b12. This paper is a study of the 2F5 NAb complexed to peptide ELDKWAS; the peptide was found to interact with amino acids near the base of the very long (22 residue) CDR 3H region of the Ab, although a Phe at the apex of the loop was also important. The authors suggest that particularly long CDR H3 regions may be a common feature of HIV-1 neuturalizing antibodies – there are 22 residues in 2F5's H3, 18 in IgG1b12's H3, and 22 residues in X5's H3. They express concern that because small animals like mice are unable to elicit Ab responses with such long H3s, they may be poor model systems for HIV vaccine studies. Zwick *et al.* [2004] (**antibody sequence variable domain**)
- IgG1b12: The SOS mutant envelope protein introduces a covalent disulfide bond between gp120 surface and gp41 transmembrane proteins into the R5 isolate JR-FL by adding cysteines at residues 501 and 605. Pseudovirions bearing this protein bind to CD4 and co-receptor bearing cells, but do not fuse until treatment with a reducing agent, and are arrested prior to fusion after CD4 and co-receptor engagement. IgG1b12 neutralized SOS and WT proteins comparably, and neither IgG1b12 nor the Fab b12 could neutralize well post-attachment, consistent with the notion that theb12 binding site would be blocked upon cellular binding. Binley *et al.* [2003]

B Cell

- IgG1b12: Called 1b12. The MAb B4e8 binds to the base of the V3 loop, neutralizes multiple primary isolates and was studied for interaction with other MAbs. CD4BS MAb IgG1b12 had no effect on B4e8 binding. Cavacini *et al.* [2003]
- IgG1b12: A sCD4-17b single chain chimera was made that can bind to the CD4 binding site, then bind and block co-receptor interaction. This chimeric protein is a very potent neutralizing agent, more potent than IgG1b12, 2G12 or 2F5 against Ba-L infection of CCR5-MAGI cells. It has potential for prophylaxis or therapy. Dey *et al.* [2003]
- IgG1b12: Four newborn macaques were challenged with pathogenic SHIV 89.6 and given post exposure prophylaxis using a combination of NAbs 2F5, 2G12, 4E10 and IgG1b12. 2/4 treated animals did not show signs of infection, and 2/4 macaques maintained normal CD4+ T cell counts and had a lower delayed peak viremia compared to the controls. Ferrantelli *et al.* [2003] (**immunoprophylaxis**)
- IgG1b12: Called b12 – CD4BS MAbs b12 (neutralizing) and 205-42-15, 204-43-1, 205-46-9 (nonneutralizing) all cross-competed for binding to monomeric gp120, indicating the topological proximity of their epitopes, however, the nonneutralizing CD4BS MAbs did not interfere with the neutralization activity of MAb b12 – the nonneutralizing MAbs partially competed with b12 for Env binding of the surface of Env-transfected cells – this suggests Env has two categories of binding site for CD4BS MAbs, one recognized by both b12 and nonneutralizing CD4BS MAbs, the other is recognized by only b12 – Ab-gp120 interactions based on the use of monomeric gp120 or Env-transfected cells do not predict the outcome of HIV-1 neutralization assays, and they should be interpreted with caution. Herrera *et al.* [2003] (**antibody binding site definition and exposure**)
- IgG1b12: MAbs IgG1b12, 2G12, 2F5 and 4E10 were tested for their ability to neutralize two primary HIV-1 clade A isolates (UG/92/031 and UG/92/037) and two primary HIV-1 clade D isolates (UG/92/001 and UG/92/005). 4E10 demonstrated the most potent cross-neutralization activity. Quadruple administration of MAbs IgG1b12, 2G12, 2F5, and 4E10 induced strong synergistic neutralization of 4 clade A isolates (UG/92/031, UG/92/037, RW/92/020 and RW/92/025) as well as 5 clade D isolates (UG/92/001,UG/9/005, /93/086/RUG/94/108, UG/94/114). The authors note this combination of 4 MAbs neutralizes primary HIV A, B, C, and D isolates. Kitabwalla *et al.* [2003] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- IgG1b12: This review dicusses the importance and function of protective antibody responses in animal model studies in the context of effective vaccine development. SHIV models have shown protection using high levels of MAbs can prevent infection, and partial protection that can influence disease course can be obtained from modest levels of NAbs. SHIV challenges studies conducted with infusions of combinations of MAbs b12, 2G12, and 2F5 are reviewed. Mascola [2003] (**review**)
- IgG1b12: AC10 is a subject who was given treatment early after infection, and had a viral rebound after cessation of therapy, which then declined to a low level. The polyclonal sera from AC10 could potently neutralize the rebound virus, and NAb escape followed with a neutralizing response against the escape variant and subsequent escape from that response. Viral loads remained low in this subject despite escape. The rebound isolate that was potently neutralized by autologous sera was not particularly neutralization sensitive, as it resisted neutralization by sCD4 and MAbs IgG1b12, 2G12 and 2F5, and was only moderately sensitive to sera from other HIV+ individuals that had high titers of NAbs to TCLA strains. Montefiori *et al.* [2003]
- IgG1b12: Called b12 – Alanine scanning mutagenesis was used to compare substitutions that affected anti-CD4BS NAb b12 binding to those that affect binding of sCD4 and two non-neutralizing anti-CD4BS Abs b3 and b6 – while the epitope maps overlapped, there were some differences observed – binding of CD4 was never enhanced, indicating it had evolved to be optimal – rec gp120s were engineered to contain combinations of Alanine substitutions that enhanced b12 binding, and while binding of b12 to these gp120 monomers was generally maintained or increased, binding by five non-neutralizing anti-CD4bs MAbs (b3, b6, F105, 15e, and F91) was reduced or completely abolished – 2G12 binding was largely unperturbed, indicating these proteins were not grossly misfolded – for twelve mutants, b12 neutralization sensitivity and affinity correlated, but for five mutants neutralization efficiency was maintained or increased despite a decrease in affinity suggesting that the subsitutions that influence b12 binding to the monomer are different than those that impact neutralization sensitivity to the trimer. Pantophlet *et al.* [2003a] (**antibody binding site definition and exposure**)
- IgG1b12: This paper describes an attempt to engineer a gp120 molecule that would focus the immune response onto the IgG1b12 epitope. Four Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with seven N-linked glycosylation site sequons and this combination minimized the binding of non-neutralizing MAbs. b12 affinity was lowered, and binding of non-neutralizing MAbs was knocked out. C1 and C5 regions were then removed to eliminate the epitopes for MAbs against these regions, but these also diminished IgG1b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- IgG1b12: Virion capture assays are not a good predictor of neutralization, and the presentation of epitopes using this assay seems to be different from that of functional Envelope spikes on primary isolates – F105 and b6 could efficiently block the b12-mediated capture of infectious virions in a virus capture, but did not inhibit b12 neutralization – b12 was potent at neutralizing the three primary virions JR-CSF, ADA, and 89.6, but anti-V3 Abs 447-52D and 19b, which did not neutralize JR-CSF and ADA captured amounts of p24 equal to or higher than the amounts captured by the neutralizing Ab b12. Poignard *et al.* [2003] (**neutralization**)
- IgG1b12: This paper shows that binding of CD4BS MAbs to Env blocks the conformational shift that allows co-receptor CCR5 binding and CD4-independent mediated cell fusion. CD4BS MAbs F105, 15e, and IgG1b12 as well as their Fab fragments inhibited CD4-independent binding of the V1/V2 loop-deleted gp120 glycoproteins of R5 HIV-1 isolates ADA, YU2 and JR-FL and to CCR5 in a concentration dependent manner. CD4BS MAbs IgG1b12, F91 and F105 and their Fab

B Cell

counterparts (except for C11, used as a negative control) inhibited CD4-independent JR-FL and YU-2 gp120-CCR5 binding to CCR5-expressing Cf2Th cells and syncytium formation. Raja *et al.* [2003] (**antibody binding site definition and exposure**)

- IgG1b12: Called b12. The NAb b12 was administered locally to the vagina in macaques and could protect against subsequent vaginal infection with SHIV-162P4. This NAb model of a topical microbicide was dose dependence, and was effective for up to 2 hours after administration. Veazey *et al.* [2003] (**immunoprophylaxis**)
- IgG1b12: Called b12. Review of current neutralizing antibody-based HIV vaccine candidates and strategies of vaccine design. Strategies for targeting of the epitopes for NAbs 2F5, 2G12, 4E10, b12, and Z13 are described. Wang [2003] (**review**)
- IgG1b12: Called b12. The Fab m18 was selected from a human phage display library by a new method called sequential antigen panning (SAP), using a series of antigens to screen the library to pick broadly cross-reactive isolates. The ability to block cell mediated fusion by m17 was compared to Fabs X5 and b12 for a clade A, CRF01 EA, G, and 6 clade B isolates, and the inhibitory activity of m18 was slightly lower but comparable to neutralizing Fabs b12 and X5. Zhang *et al.* [2003]
- IgG1b12: The HIV-1 primary isolate DH012 has preserved the epitopes for the MAbs IgG1b12, 2G12, 17b, however natural DH012 infection in chimpanzees and DH012 gp120 vaccination in guinea pigs does not give rise to Abs against these epitopes. Zhu *et al.* [2003] (**vaccine antigen design**)
- IgG1b12: 4KG5, a single-chain Fv (scFv), reacts with a conformational epitope that is formed by the V1, V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Denaturation of gp120 abolished binding of 4KG5 and Fab b12. Addtionally, binding of 4KG5 was abrogated when any of the V1, V2 or V3 loops were deleted. Of a panel of Abs tested, only NAb b12 enhanced 4KG5 binding to gp120 JR-FL. MAbs to the following regions diminished or abroated binding: V2 loop MAbs (G3-4, G3-136), V3 loop MAbs (19b, 447-52D, hNM01, AH48, loop2, F425 B4e8, 694-88D), V3-C4 (G3-299, G3-42, G3-519, G3-537), CD4BS (b6, b3, F91, F105, 15e, L33, 1008-D, 654-30D, 559-64D, 1027-30D, Ia3, Ia7, FG39, Fbb14). MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1, V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. 4KG5 did not enhance IgG1b12 neutralization. Zwick *et al.* [2003] (**antibody interactions**)
- IgG1b12: IgG1b12 neutralized many South African (5/8) and Malawian (4/8) clade C primary HIV-1 isolates, being more effective than 2F5 which neutralized only two Malawian and no South African isolates. 2G12 did not neutralize any of the 16 isolates. Bures *et al.* [2002] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- IgG1b12: This study examined Ab interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4 isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate. Anti-gp41 MAb F240 enhanced the binding of CD4BS MAbs IgG1b12 and F105 to both R5X4 and R5 isolates, but had no effect on neutralization. Anti-V3 MAb B4a1 increased CD4BS MAbs IgG1b12 and F105 to R5X4 virions, but only IgG1b12 binding was increased by B4a1 to the R5 isolate, and neutralization was not impacted. Cavacini *et al.* [2002] (**antibody interactions**)
- IgG1b12: A modified gp140 (gp140ΔCFI), with C-term mutations intended to mimic a fusion intermediate and stabilize trimer formation, retained antigenic conformational determinants as defined by binding to CD4 and to MAbs 2F5, 2G12, F105, and b12, and enhanced humoral immunity without diminishing the CTL response in mice injected with a DNA vaccine. Chakrabarti *et al.* [2002]
- IgG1b12: Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. Edwards *et al.* [2002] (**antibody binding site definition and exposure**)
- IgG1b12: Review of NAbs that notes IgG1b12 is a recombinant IgG1 from a phage displayed Fab generated against gp120 from a B clade infected individual, that it binds the CD4BS, that alone or in combination with other MAbs it can protect some macaques against SHIV infection, and that it has strong ADCC activity. Ferrantelli & Ruprecht [2002] (**review**)
- IgG1b12: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – the preincubation 31.5 C step did not alter the inhibitory activity of neutralizing Abs anti-gp41 2F5, or anti-gp120 2G12, IG1b12, 48d, and 17b. Golding *et al.* [2002b]
- IgG1b12: HIV-1 gp160ΔCT (cytoplasmic tail-deleted) proteoliposomes (PLs) containing native, trimeric envelope glycoproteins from R5 strains YU2 and JRFL, and X4 strain HXBc2, were made in a physiologic membrane setting as candidate immunogens for HIV vaccines—2F5 bound to gp160ΔCT with a reconstituted membrane ten-fold better than the same protein on beads—anti-CD4BS MAbs IgG1b12 and F105, A32 (C1-C4), C11 (C1-C5), and 39F (V3) MAbs bound gp160ΔCT PLs indistinguishably from gp160ΔCT expressed on the cell surface—non-neutralizing MAbs C11 and A32 bound with lower affinity than NAb IgG1b12—the MAb 17b was sCD4 inducible on gp160ΔCT PL. Grundner *et al.* [2002]
- IgG1b12: A broad review of NAbs that mentions IgG1b12 as an example of a NAb that does not alter the conformation of gp120, but interferes with CD4 binding. Klasse & Sattentau [2002] (**review**)
- IgG1b12: Called b12. Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the

B Cell

HXBc2 core. Enthalpy and entropy changes were divergent, but compensated. CD4 and MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs (17b, 48d, 1.5e, b6, F105 and F91) had large entropy contributions to free energy of binding to the gp120 monomer (mean: 26.1 kcal/mol, range 18.6-31.5), but the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. The high values suggest surface burial or protein folding and ordering of amino acids upon binding. NAb 2G12 had an entropy value of -1.6. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding that is not faced by other anti-gp120 antibodies. Kwong *et al.* [2002] (**structure**)

- IgG1b12: Recombinant adeno-associated virus was used to deliver the IgG1b12 gene into mice by injection. IgG1b12 was expressed in these mice for over 6 months after the primary injection. This strategy allows for predetermined Ab specificity, and could ultimately be used with synergistic Ab combinations. Lewis *et al.* [2002]
- IgG1b12: A pseudotyping assay showed that an X4 V3 loop peptide could enhance infectivity of X4 virus, R5 and R5X4 V3 loops peptides could enhance infectivity of an R5 virus, and R5X4 peptides could enhance infectivity of an R5X4 virus. Neither R5 nor R5X4 peptides influenced binding of CD4BS MAbs F105 and Ig1Gb12, but did increase binding of CD4i MAb 17b. Ling *et al.* [2002]
- IgG1b12: Review of NAbs that discusses mechanisms of neutralization, passive transfer of NAbs and protection in animal studies, and vaccine strategies. Liu *et al.* [2002] (**review**)
- IgG1b12: Deglycosylation of gp120 does not significantly affect IG1b12 binding, in contrast to MAB 2G12. Sanders *et al.* [2002] (**antibody binding site definition and exposure**)
- IgG1b12: The crystal structure of IgG1b12 is resolved and is the first structure of an intact human Ab with an ordered, full length hinge – the structure is extremely asymmetric and flexible with an antigen-binding site that has an unusually long CDR H3 region with a ten residue insertion that projects above the rest of the antigen-binding site – this loop may be required for recognition of the recessed CD4 binding site of gp120. Saphire *et al.* [2002] (**antibody binding site definition and exposure**, **antibody sequence variable domain**, **structure**)
- IgG1b12: Alanine scanning mutagenesis used in conjunction with competition and replacement studies of N-linked carbohydrates and sugars suggest that the 2G12 epitope is formed from mannose residues contributed by the glycans attached to N295 and N332, with the other N-linked carbohydrates in positions N339, N386, and N392 playing a role in maintaining conformation relevant to 2G12 binding – N295A and N332A mutants showed essentially unchanged anti-CD4BS NAb b12 binding affinities, while N339A, N386A and N392A mutants displayed significantly lowered b12 affinity, presumably due to conformational changes. Scanlan *et al.* [2002] (**antibody binding site definition and exposure**)
- IgG1b12: Ab binding characteristics of SOS gp140 were tested using SPR and RIPA – SOS gp140 is gp120-gp41 bound by a disulfide bond – NAbs 2G12, 2F5, IgG1b12, CD4 inducible 17b, and 19b bound to SOS gp140 better than uncleaved gp140 (gp140unc) and gp120 – non-neutralizing MAbs 2.2B (binds to gp41 in gp140unc) and 23A (binds gp120) did not bind SOS gp140 – SOS gp140-2F5-IgG1b12 formed multiple ring structures composed of two SOS gp140 proteins bridged by two Ab molecules, while 2F5 and 2G12 formed extended chains rather than closed rings. Schulke *et al.* [2002] (**vaccine antigen design**)
- IgG1b12: Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent – antigen capture ELISA was used to compare the antigenicity of gp120 and o-gp140 using a panel of well characterized MAbs – Abs directed against the CD4 binding site (IgGCD4 and IgG1b12) reacted slightly more strongly with the gp120 monomer than with the oligomer, as did sCD4. Srivastava *et al.* [2002] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- IgG1b12: Called ARP3065: Herpesvirus saimiri-immortalized CD4+ T lymphocytes (HVS T cells) were used to isolate virus and perform HIV-1 neutralization assays, and compared with a standard PBMC protocol – neutralization sensitivities to a panel of MAbs and to homologous or heterologous plasma/sera were similar for HVS T cells (CN-2 cells) and PBMCs. Vella *et al.* [2002] (**neutralization**)
- IgG1b12: A series of mutational changes were introduced into the YU2 gp120 that favored different conformations – 375 S/W seems to favor a conformation of gp120 closer to the CD4-bound state, and is readily bound by sCD4 and CD4i MAbs (17b, 48d, 49e, 21c and 23e) but binding of anti-CD4BS MAbs (F105, 15e, IgG1b12, 21h and F91 was markedly reduced – IgG1b12 failed to neutralize this mutant, while neutralization by 2G12 was enhanced – 2F5 did not neutralize either WT or mutant, probably due to polymorphism in the YU2 epitope – another mutant, 423 I/P, disrupted the gp120 bridging sheet, favored a different conformation and did not bind CD4, CCR5, or CD4i antibodies, but did bind to CD4BS MAbs. Xiang *et al.* [2002b] (**antibody binding site definition and exposure**, **neutralization**)
- IgG1b12: Passive immunization of neonate macaques with a combination of F105+2G12+2F5 conferred complete protection against oral challenge with SHIV-vpu+ or – the combination b12+2G12+2F5 conferred partial protection against SHIV89.6 – such combinations may be useful for prophylaxis at birth and against milk born transmission – the synergistic combination of IgG1b12, 2G12, 2F5, and 4E10 neutralized a collection of HIV clade C primary isolates. Xu *et al.* [2002]
- IgG1b12: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin—stabilized oligomer gp140Δ683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and C11, A32, and 30D which did not bind the stabilized oligomer. Yang *et al.* [2002] (**vaccine antigen design**)

B Cell

- IgG1b12: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002] (**antibody binding site definition and exposure**)
- IgG1b12: Called IgG1 b12. IgG1b12 induces strong ADCC and CDC cytoxicity of HIV-1 infected cells. A panel of mutants in the Fc region of IgG1b12 was generated. K322A reduced ADCC binding of FcγR and abolished complement-dependent cytotoxicity (CDC) and C1q binding. L234A plus L235 in the lower hinge region of the IgG1 heavy chain abolished both FcγR and C1q binding and ADCC and CDC. These mutants did not impact IgG1b12's ability to neutralize virus. Hezareh *et al.* [2001]
- IgG1b12: A combination of MAbs IgG1b12, 2F5, and 2G12 was given postnatally to four neonates macaques that were then challenged with highly pathogenic SHIV89.6P – one of the four infants remained uninfected after oral challenge, two infants had no or a delayed CD4(+) T-cell decline – the most potent combination included IgG1b12, which alone does not alone neutralize SHIV89.6P. Hofmann-Lehmann *et al.* [2001] (**antibody interactions**, **immunoprophylaxis**)
- IgG1b12: Mutations in two glcosylation sites in the V2 region of HIV-1 ADA at positions 190 and 197 (187 DNTSYR-LINCNTS) cause the virus to become CD4-independent and able to enter cells through CCR5 alone – these same mutations tended to increase the neutralization sensitivity of the virus, except the mutation 197 S/R which resulted in a carbohydrate addition to 195 N that disrupts the IgG1b12 binding site. Kolchinsky *et al.* [2001] (**antibody binding site definition and exposure**)
- IgG1b12: Intravenous passive transfer of MAb b12 provides dose-dependent protection from infection to macaques vaginally challenged with the R5 virus SHIV(162P4) – the primary isolate HIV-1SF162 is neutralized 90% (IC90) by b12 at 2 µg/ml, and SHIV162P4, derived from HIV-1SF162, was neutralized by 90% at 2 µg/ml in PHA-activated PBMC from rhesus macaques – the 90% neutralization titers achieved in three groups of animals that were given 25-, 5-, and 1-mg/kg doses were approximately 1:400, 1:80, and 1:16, respectively – the half-life of IgG1 b12 in plasma was about 1 week, but while the peak b12 plasma concentration was immediately after the infusion, the peak vaginal fluid concentration was 7-14 days later. Parren *et al.* [2001] (**immunoprophylaxis**, **kinetics**)
- IgG1b12: Structural aspects of the interaction of neutralizing Abs with HIV-1 Env are reviewed – Env essentially has three faces, one is largely inaccessible on the native trimer, and two that exposed but have low immunogenicity on primary viruses – neutralization is suggested to occur by inhibition of the interaction between gp120 and the target cell membrane receptors as a result of steric hindrance and it is noted that the attachment of approximately 70 IgG molecules per virion is required for neutralization, which is equivalent to about one IgG molecule per spike – the 2G12, 17b and b12 epitopes are discussed in detail – the structure of CD4-bound gp120 reveals features that HIV has evolved to escape anti-CD4BS Abs like IgG1b12 despite profound functional constraints – CD4BS Abs must first access the CD4 binding site, deeply recessed within the gp120 core, and the Fab of an Ab molecule is "wider" than CD4, and in addition the binding site is flanked by variable and glycosylated regions. Poignard *et al.* [2001] (**review**, **structure**)
- IgG1b12: This paper describes the technical aspects of the crystallization of b12 at a resolution of 2.7 angstroms with all 12 Ig domains resolved. Saphire *et al.* [2001a] (**structure**)
- IgG1b12: This paper describes the biological implications of the crystal structure of b12 – a remarkable feature of this antibody is a long protruding finger-like CDR H3 that can dock in the recessed CD4-binding site – a contact residues in gp120 are modeled, with numbering based on the variable loop-deleted crystal structure of gp120. Saphire *et al.* [2001b] (**structure**)
- IgG1b12: SHIV-HXBc2 is a neutralization sensitive non-pathogenic virus, and several *in vivo* passages through monkey's yielded highly pathogenic SHIV KU-1 – HXBc2 and the KU-1 clone HXBc2P3.2 differ in 12 amino acids in gp160 – substitutions in both gp120 and gp41 reduced the ability of sCD4, IgG1b12, F105 and AG1121 to Env achieve saturation and full occupancy, and neutralize KU-1 – 17b and 2F5 also bound less efficiently to HXBc2P3.2, although 2G12 was able to bind both comparably. Si *et al.* [2001]
- IgG1b12: A luciferase-reporter gene-expressing T-cell line was developed to facilitate neutralization and drug-sensitivity assays – luciferase and p24 antigen neutralization titer end points were found comparable using NAb from sera from HIV+ donors, and MAbs 2F5, 2G12 and IgG1b12. Spenlehauer *et al.* [2001] (**assay development**)
- IgG1b12: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 M Abs 50-69 and 98-6, as well as 98-6 and 2F5. Verrier *et al.* [2001] (**antibody interactions**, **co-receptor**)
- IgG1b12: Twenty HIV clade C isolates from five different countries were susceptible to neutralization by anti-clade B MAbs in a synergistic quadruple combination of mAbs IgG1b12, 2G12, 2F5, and 4E10. Xu *et al.* [2001] (**subtype comparisons**)
- IgG1b12: Primary isolates YU2 and ADA are more resistant to IgG1b12 neutralization than HXBc2: 90% Neutralization of HXBc2 is observed with 1.25 ug of IgG1b12, while ADA and YU2 require 2.5 and 5 ug respectively to achieve 50% neutralization, and 90% neutralization could not be achieved with 10 or 20 ug of IgG1b12, respectively. Yang *et al.* [2001] (**variant cross-recognition or cross-neutralization**)

B Cell

- IgG1b12: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding. York *et al.* [2001] (**variant cross-recognition or cross-neutralization**)
- IgG1b12: Neutralizing synergy between MAbs 1b12, 2G12 and 2F5 was studied using surface plasmon resonance to determine the binding kinetics for these three MAbs with respect to monomeric and oligomeric env protein gp160 IIIB – the 2G12 epitope is highly accessible on both monomeric and oligomeric Envs, 1b12 is highly accessible on monomers but not oligomers, and 2F5 on neither form – binding of 2G12 exposes the 2F5 epitope on gp160 oligomers. Zeder-Lutz *et al.* [2001] (**antibody interactions**)
- IgG1b12: b12 recognizes a conformational epitope that overlaps with the CD4 binding site – a phage displayed peptide library was used to identify a peptide which bound b12, called B2.1, which competes with b12 in competition assays – B2.1 has significant homology to the D loop of gp120: upper case letters indicate residues B2.1 shares with gp120, heRsymFS-DlenrcI – one of the goals of defining peptide mimics to the b12 epitope is to develop an immunogen that can stimulate b12-like antibodies, but B2.1 cross-linked to phage and ovalbumin bound IgG1b12 did not elicit cross-reactive gp120 Abs in mice or rabbits. Zwick *et al.* [2001a] (**antibody binding site definition and exposure**, **mimotopes**)
- IgG1b12: This paper primarily concerns 4E10 and Z13, MAbs that both bind proximally to the 2F5 binding site to a conserved epitope, and that neutralize some primary isolates from clades B, C, and E – broadly neutralizing MAbs 2F5, IgG1b12, and 4E10 and Z13 fail to neutralize different subsets of viruses. Zwick *et al.* [2001b] (**subtype comparisons**)
- IgG1b12: Neutralization synergy between anti-HIV NAbs b12, 2G12, 2F5, and 4E10 was studied – a classic fixed-ratio method was used, as well as a method where one Ab was fixed at a low neutralization titer and the other was varied – using primary isolates, a two-four fold enhancement of neutralization was observed with MAb pairs, and a ten-fold enhancement with a quadruple Ab combination – no synergy was observed with any MAb pair in the neutralization of TCLA strain HXB2 – whole IgG1b12 and b12 Fab fragments behaved similarly in the neutralization assays – there was no evidence for cooperativity of binding between b12 and 2G12 to envelope spikes expressed on the cell surface of TCLA or primary isolates. Zwick *et al.* [2001c] (**antibody interactions**)
- IgG1b12: To determine the antigenicity of virus killed by thermal and chemical inactivation, retention of conformation-dependent neutralization epitopes was examined, and exposure of CD4BS epitopes was found to be enhanced (MAbs IgG1b12, 205-46-9, and 205-43-1) – binding to 2G12 and 447-52D epitopes was essentially unaltered – the 17b CD4i epitope was also exposed. Grovit-Ferbas *et al.* [2000] (**vaccine antigen design**)
- IgG1b12: SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447-D and 391-95D) – V2-region glycosylation site mutations did not enhance neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows increased infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. Ly & Stamatatos [2000] (**escape**)
- IgG1b12: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 6 CD4BS MAbs – CD4BS MAbs bound consistently to most isolates of clade D, but poorly to isolates of other clades with the exception of broadly reactive MAb IgG1b12, binding to 22 of 26 isolates tested – 8 MAbs were tested for neutralization and MAb IgG1b12 was most potent, with 90% neutralization of 3/5 isolates tested. Nyambi *et al.* [2000] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- IgG1b12: Fab b12 was used – six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. Park *et al.* [2000]
- IgG1b12: rgp120 derived from a R5X4 subtype B virus was used to vaccinate healthy volunteers and the resulting sera were compared with sera from HIV-1 positive subjects and neutralizing MAbs – TCLA strains showed enhanced IgG1b12 neutralization sensitivity relative to PBMC-adapted lines – IgG1b12 was able to bind, with low affinity, to the rgp120 monomer HIV-1 W61D. Beddows *et al.* [1999] (**co-receptor**)
- IgG1b12: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. Binley *et al.* [1999] (**vaccine antigen design**)
- IgG1b12: Neutralization assays with rsCD4, MAbs, and serum samples from SHIV-infected macaques and HIV-1 infected individuals were used to characterize the antigenic properties of the env glycoprotein of six primary isolate-like or TCLA SHIV variants. IgG1b12 neutralized SHIV strains HXBc2, KU2, 89.6, but not 89.6P and KB9. 89.6

B Cell

is a dual tropic primary isolate that is not pathogenic in macaques, 89.6P is a highly pathogenic form of 89.6 obtained after passage in macaques, and KB9 is a molecular clone of 89.6P. Neutralization resistance was cell line independent. Crawford *et al.* [1999] (**variant cross-recognition or cross-neutralization**)

- IgG1b12: The presence of leukocyte function-associated molecule 1 (LFA-1) promotes virus infectivity and hinders neutralization, and anti-LFA-1 MAbs can enhance the neutralizing effect of anti-HIV V3 MAb 447-52D and anti-HIV CD4BS MAb IgG1b12 – non-neutralizing anti-HIV CD4BS MAb 654-D did not become neutralizing in the presence of anti-LFA-1 MAbs. Hioe *et al.* [1999] (**antibody interactions**)
- IgG1b12: does not inhibit attachment of virus to cells and was used as a control of a study of neutralization by a MAb F58 based micro antibody. Jackson *et al.* [1999]
- IgG1b12: A meeting summary presented results regarding neutralization – D. Burton and J. Mascola presented results concerning passive immunization and protection of hu-PBL-SCID mice and macaques, respectively, and both found combinations of MAbs that were able to achieve 99% neutralization *in vitro* corresponded to efficacy *in vivo*. Montefiori & Evans [1999] (**review**)
- IgG1b12: Hu-PBL-SCID mice were infected with HIV-1s JRCSF and SF162 to study the effect of NAbs on an established infection – at day 6 post infection, mice were given 50 mg/kg of b12, an amount that would have been protective if given up to 8 hours post-infection, and 100-fold higher than the amount required for 90% neutralization *in vitro* – no significant differences in the initial rate of decrease in viral load or the plateau levels of viral RNA between the b12 treated and control mice were seen – in most of the Ab treated mice escape mutants were observed with varying patterns of mutations – a combination of b12, 2G12 and 2F5 protected 1/3 mice, and an isolate from one of the other two was resistant to neutralization by all three MAbs. Poignard *et al.* [1999] (**escape**, **immunotherapy**)
- IgG1b12: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer – CD4BS MAbs 15e, F91 and IgG1b12 bound better to the deleted protein than to wild type. Binley *et al.* [1998] (**antibody binding site definition and exposure**)
- IgG1b12: Immunoprecipitation of gp120 and gp160 expressed from a rec Semliki Forest virus by F105 and IgG1b12 indicated that the SFV expressed HIV-1 Env was folded appropriately – and SVF-HIV-1 Env vaccine gave the strongest anti-HIV-1 Env response in mice, when compared to an HIV-1 Env DNA vaccine and a rgp160 protein. Brand *et al.* [1998] (**vaccine antigen design**)
- IgG1b12: Ab from gp120 vaccinated individuals prior to infection, who subsequently became HIV infected, could not achieve 90% neutralization of the primary virus by which the individuals were ultimately infected – these viruses were not particularly refractive to neutralization, as determined by their susceptibility to neutralization by MAbs 2G12, IgG1b12, 2F5 and 447-52D. Connor *et al.* [1998] (**variant cross-recognition or cross-neutralization**)
- IgG1b12: Binds JRSF oligomer with high affinity, as do 205-46-9 and 2G6, but IgG1b12 is neutralizing, the other two are not – conclusions of this paper contrast with Parren98 – authors propose a model where 205-46-9 and 2G6 may inhibit CD4 binding, but cause a conformational shift which enhances CCR5 binding and thus counteracts the neutralizing effect – rank order of CD4BS antibodies oligomer binding is IgG1b12 = 2G6 = 205-46-9 > 205-43-1 = 205-42-15 > 15e = 21h = F91, and the only thing notably distinguishing about neutralizing IgG1b12 is that it depends on residues in V2. Fouts *et al.* [1998] (**antibody binding site definition and exposure**)
- IgG1b12: Infection of dendritic cells cultured from CD14+ blood cells or from cadaveric human skin was blocked by neutralizing MAbs IgG1b12, or 2F5 and 2G12 delivered together, but not by control non-neutralizing anti-gp120 MAb 4.8D, indicating that NAbs could interrupt early mucosal transmission events. Frankel *et al.* [1998] (**antibody interactions**, **mucosal immunity**)
- IgG1b12: anti-C1 region MAb 87-135/9 blocks gp120 interaction with CD4+ cells – blocking activity is additive when combined with antibodies which bind in the C4 region of gp120 (F105, 388/389, and b12). Kropelin *et al.* [1998] (**antibody interactions**)
- IgG1b12: Enhances binding of Hx10 to CD4 positive or negative HeLa cells, inhibits binding to CD4+ T-cell line A3.01 – neutralizes HeLa and A3.01 cell Hx10 infection. Mondor *et al.* [1998]
- IgG1b12: IgG1b12, Fab b12 and 3B3 derived from b12 were all included in this study – the rank order of Fab binding affinity to monomeric gp120 (Loop 2 > 3B3 > b12 = DO8i > b11 > b3 > b14 > b13 > DO142-10 > DA48 > L17) was markedly different than Fab binding affinity to the mature oligomeric form (3B3 > b12 > DO142-10 > Loop 2 > b11 > L17 > b6 > DO8i > b14 > DA48 > b3 > b13) and binding to oligomeric form and neutralization were correlated for both Fabs and MAbs – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope – binding affinity of divalent IgG1b12 is 17-fold greater than monovalent Fab b12. Parren *et al.* [1998a] (**binding affinity**)
- IgG1b12: MAbs 2G12, 2F5 and b12 are broadly neutralizing, as are some human polyconal sera, but this paper describes a set of primary isolates that are resistant to all three MAbs and 2 broadly neutralizing sera – results indicate that resistance levels of pediatric isolates might be higher than adult isolates – resistance in general did not seem to be conferred by a loss of binding affinity for gp120 or gp41, rather by a more global perturbation of oligomeric Envelope. Parren *et al.* [1998b] (**variant cross-recognition or cross-neutralization**, **responses in children**)
- IgG1b12: MAbs 654-D100 and IgG1b12 neutralized viruses HIV-BRU and a mutated virus that lacks the V3 loop glycan equally effectively – in contrast, sera from guinea pigs immunized with BRU gp120 neutralize viruses more effectively that lack the V3 glycan. Schonning *et al.* [1998] (**antibody binding site definition and exposure**)
- IgG1b12: Deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in

B Cell

PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V2, but not V1, diminished neutralization by CD4BS MAb IgG1b12, in contrast to 654.30D and IgGCD4. Stamatatos & Cheng-Mayer [1998] (**vaccine antigen design**)

- IgG1b12: Fab b12 – the HIV-1 virus YU2 entry can be enhanced by MAbs binding to the CD4BS, V3 loop, and CD4i epitopes – the activation for this enhanced entry state could be conferred on HxB2 by introducing the YU2 V3 loop, or the YU2 V3 and V1/V2 loops – a similar effect is observed by sub-neutralizing concentrations of sCD4 and the effect is dependent of CCR5 – Fab fragment b12 also enhances YU2 entry, ruling out Fc interactions or Env cross-linking as a mechanism, while neutralizing HXBc2. Sullivan *et al.* [1998a]
- IgG1b12: Induces Complement-mediated lysis in MN but not primary isolates – primary isolates are refractive to CML. Takefman *et al.* [1998] (**complement**)
- IgG1b12: MAb was slightly more efficient at neutralization than Fab – inhibits viral binding to cells and viral entry – doesn't affect CD4-independent binding to T-cells. Valenzuela *et al.* [1998]
- IgG1b12: Summary of the implications of the crystal structure of the core of gp120 bound to CD4 and 17b with what is known about mutations that reduce NAb binding – probable mechanism of neutralization by CD4BS Ab is direct interference with CD4 binding – IgG1b12 is an unusual CD4BS antibody because it is particularly potent as a neutralizing antibody and it is susceptible to changes in the V1-V2 stem loop structure, and so it may disrupt an interaction between CD4 and conserved amino acids on the V1-V2 stem. Wyatt *et al.* [1998] (**structure**)
- IgG1b12: Abs that recognize discontinuous epitopes can identify mimotopes from a phage peptide display library – IgG1b12 blocks CD4 binding and is the most potent neutralizing Ab – many 15 and 21-mer phage inserts were recognized, but it was not possible to derive a consensus – common features were a W and at least one acidic residue, and one sequence was found multiple times: NWPRWWEEFVDKHSS, and this peptide could compete with gp120 – two short stretches found in the phage peptides might mimic gp120 components of the epitope: positions 382-384, FFY(I), and 423-426 I(FV)I(V)NM. Boots *et al.* [1997] (**mimotopes**)
- IgG1b12: This is a review that includes a description of IgG1b12, noting approximately equivalent affinities for sgp120 and unprocessed gp160, and somewhat enhanced affinity for the native oligomer on TCLA viruses – primary viruses have reduced affinity, but still in the useful range for neutralization – there can be complete protection in hu-PBL-SCID mice with Ab even when administered several hours after viral challenge – competes with sCD4, but unlike other CD4BS antibodies, it is sensitive to mutations in V2. Burton & Montefiori [1997] (**review**)
- IgG1b12: In a multilab evaluation of monoclonal antibodies, only IgG1b12, 2G12, and 2F5 could neutralize at least half of the 9 primary test isolates at a concentration of < 25 mug per ml for 90% viral inhibition – IgG1b12 failed to neutralize only 1/9 primary isolates, although there was some variation between test sites. D'Souza *et al.* [1997] (**variant cross-recognition or cross-neutralization**, **assay standardization/improvement**)
- IgG1b12: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – IgG1b12 bound monomer, oligomer, and neutralized JRFL. Fouts *et al.* [1997] (**antibody binding site definition and exposure**)
- IgG1b12: b12 was used in its IgG1 form – of 14 human MAbs, the most potent neutralizer of SHIV-vpu+, which expressed HIV-1 IIIB env – all Ab combinations tested showed synergistic neutralization – b12 has a synergistic response with MAbs 694/98-D (anti-V3), 2F5, and 2G12. Li *et al.* [1997] (**antibody interactions**)
- IgG1b12: JRCSF was cultured in the presence of IgG1b12 until a 100-fold resistance to neutralization was selected – resistance was due to three changes: V2 substitution D182N and C3 substitution P365L conferred resistance, and V2 D164N was also required for a viable virus – IgG1b12 resistant virus remained sensitive to MAbs 2G12 and 2F5. Mo *et al.* [1997] (**escape**)
- IgG1b12: Review: MAbs 2F5, 2G12 and IgG1b12 have potential for use in combination with CD4-IgG2 as an immunotherapeutic or immunoprophylactic – homologous MAbs to these are rare in humans and vaccine strategies should consider including constructs that may enhance exposure of these MAbs' epitopes. Moore & Trkola [1997] (**review**)
- IgG1b12: Complete protection against HIV-1 infection was achieved in hu-PBL-SCID mice by passive immunization with physiologically relevant doses – pharmacokinetics showed serum half-life of 30.2 +/- 1.3 hours for Fab b12 and 7.4 +/- 0.7 days for IgG1 b12 in mice, but IgG1 half-lives in human are generally between 21-23 days. Parren *et al.* [1995]; Parren & Burton [1997] (**immunoprophylaxis**)
- IgG1b12: In this review, the technique and potential application of Fab expression and selection in phage display libraries, and subsequent production of IgG molecules is discussed – b12 is exceptionally potent at neutralization and can successfully neutralize most B clade primary isolates, and many isolates from other subtypes as well – 3B3 was derived from b12 by selection for higher affinity using the CDR walking strategy – 3B3 has 8-fold enhancement of binding, a linear correlation was found between neutralization and affinity, and 3B3 can neutralize strains b12 cannot. Parren & Burton [1997] (**binding affinity**, **review**)
- IgG1b12: Fab b12 is unusual in that it binds to gp140 and monomeric gp120 with similar affinities, and with a higher affinity to the native oligomer—authors propose this antibody may be exceptional because it binds the virus rather than viral debris—IgG1b12 can protect against infection prior to or shortly after challenge of hu-PBL-SCID mice with TCLA strains and primary strains, but the serum concentrations required *in vivo* were higher than for *in vitro* neutralization. Parren *et al.* [1997b,a] (**antibody binding site definition and exposure**, **immunoprophylaxis**)
- IgG1b12: Inhibited some SI- and NSI-env chimeric viruses but enhanced one NSI-env chimeric virus 3 fold. Schutten

B Cell

et al. [1997] (**enhancing activity**, **variant cross-recognition or cross-neutralization**)
- IgG1b12: Viral binding inhibition by IgG1b12 strongly correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5). Ugolini *et al.* [1997]
- IgG1b12: Major deletions in C1 and C5 and deletions of the V1V2 and V3 loops do not diminish binding. Wyatt *et al.* [1997] (**antibody binding site definition and exposure**)
- IgG1b12: Saturation mutagenesis of the complementarity-determining region and optimization strategies were used to create very high affinity versions of this Fab – increased affinity was dominated by a slowing of the off rate. Yang *et al.* [1997c] (**binding affinity**)
- IgG1b12: 35 primary isolates were tested and all were neutralized by IgG1b12 (including 4, UG270, RW92/026, ZB20, and 301727 which been had reported as not neutralized by IgG1b12 Trkola *et al.* [1995]) – IgG1b12 could neutralize even when added after the virus to the culture – selection for 400-fold increased affinity did not enhance neutralization by antibody – IgG1b12 was more potent with greater breadth than MAb 2F5 Kessler II *et al.* [1997]. Kessler II *et al.* [1997]; Trkola *et al.* [1995] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- IgG1b12: Potent neutralizing *ex vivo* of virus taken directly from plasma of HIV-1 infected individuals – little correlation between neutralization sensitivity of passaged virus and plasma derived virus – more effective than MAb 19b. Gauduin *et al.* [1996] (**antibody interactions**)
- IgG1b12: Review: Unique among anti-CD4BS MAbs in terms of being potent against both lab adapted virus and primary isolates – one of three MAbs (IgG1b12, 2G12, and 2F5) generally accepted as having significant potency against primary isolates. Poignard *et al.* [1996b] (**review**)
- IgG1b12: Anti-CD4BS MAbs 15e, 21h, and IgG1b12 did not cause gp120 dissociation from virus, or exposure of the gp41 epitope of MAb 50-69, in contrast to CD4i MAb 48d and anti-V3 neutralizing MAbs. Poignard *et al.* [1996a] (**antibody interactions**)
- IgG1b12: Review: Only four epitopes have been described which can stimulate a useful neutralizing response to a broad spectrum of primary isolates, represented by the binding sites of MAbs: 447-52-D, 2G12, Fab b12, and 2F5. Sattentau [1996] (**review**)
- IgG1b12: Neutralizes JR-FL – inhibits gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a] (**antibody binding site definition and exposure**)
- IgG1b12: Because Fab b12 shows reduction in binding when the V2 loop is deleted and when aa 183/184 PI/SG substitutions are made competition studies were done with Fab L78 and anti-V2 MAbs SC258 and 684-238 and they do not compete with IgG1b12. Ditzel *et al.* [1995] (**antibody interactions**)
- IgG1b12: Called BM12 – broad cross-clade neutralization of primary isolates – additive neutralization in combination with MAb 2F5. Kessler *et al.* [1995] (**antibody interactions**)
- IgG1b12: Anti-CD4 binding site MAb – very potent neutralization of a number of primary isolates. Moore *et al.* [1995a]
- IgG1b12: Review: unusual properties for anti-CD4 BS MAb: sensitive to V2 substitutions, preferential recognition of the oligomer on the cell surface. Moore & Ho [1995] (**review**)
- IgG1b12: Formalin inactivation of virus at 0.1% formalin for 10 hours at 4 degrees was optimal for inactivation of virus while maintaining epitope integrity. Sattentau *et al.* [1995]
- IgG1b12: Fab b12 showed potent neutralization of T-cell-line-adapted strains, but much reduced neutralization of 3 primary isolates – 2 of the 3 primary isolates also had reduced binding affinity, but the third was as efficiently immunoprecipitated as HXBc2. Sullivan *et al.* [1995] (**variant cross-recognition or cross-neutralization**)
- IgG1b12: Could potently neutralize primary isolates from within clade B, but showed a slight reduction in efficacy outside of clade B. Trkola *et al.* [1995] (**subtype comparisons**)
- IgG1b12: Very potent neutralization, of primary and lab strains, at concentrations that could be achieved by passive immunization – reduced binding with A,C, and D clade viruses relative to B clade, poor reactivity with E clade – isolates that were refractive to neutralization by sera from HIV-1 + donors could be neutralized by IgG1 b12. Burton *et al.* [1994] (**variant cross-recognition or cross-neutralization**)
- IgG1b12: Cross-reactive with some gp120s, (but not all), from clades A-D – not reactive with gp120 from clades E or F. Moore *et al.* [1994b] (**variant cross-recognition or cross-neutralization**)
- IgG1b12: Anti-CD4 binding site Fab, potent neutralizing activity, greater affinity for a subpopulation of gp120 molecules suggested to be in a mature confirmation – mutations in gp120 that abrogate binding: 368 D/R or D/T, 370 E/R, and 477 D/V, of clone HXBc2 of LAI – sensitive to V1 and V2 substitutions. Roben *et al.* [1994] (**antibody binding site definition and exposure**)
- IgG1b12: The original Fab fragment was derived from a combinatorial phage library from bone marrow of an HIV-1 positive individual who had been asymptomatic for six years. Burton *et al.* [1991] (**antibody generation**)

Keywords	antibody binding site definition and exposure, binding affinity, neutralization, subtype comparisons

- IgGCD4: The study explores how the V1 loop of Env influences the neutralization susceptibilities of heterologous viruses to antibodies elicited by the SF162gp140 immunogen. All viruses expressing the WT Envs were susceptible to neutralization by IgGCD4. Replacement of the V1 loops by that of SF162 did not alter the neutralization susceptibilities of the viruses, with the exception of one virus, which became more susceptible. Ching *et al.* [2008] (**neutralization**)

- IgGCD4: Trimeric envelope glycoproteins with a partial deletion of the V2 loop derived from subtype B SF162 and subtype C TV1 were compared. IgGCD4 recognized both subtype B and C trimers. Subtype C trimer had many biophysical, biochemical, and immunological characteristics similar to subtype B trimer, except for a difference in the three binding sites for CD4, which showed cooperativity of CD4 binding in subtype C but not in subtype B. Srivastava *et al.* [2008] (**subtype comparisons**)
- CD4-Ig: Point mutations in the highly conserved structural motif LLP-2 within the intracytoplasmic tail of gp41 resulted in conformational alternations of both gp41 and gp120. The alternations did not affect virus CD4 binding, coreceptor binding site exposure, or infectivity of the virus, but did result in decreased binding and neutralization by certain MAbs and human sera. CD4-Ig exhibited similar levels of binding to both the LLP-2 mutant and wildtype viruses, indicating that its epitope was not altered by the mutation. Kalia *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)
- IgGCD4: Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent – antigen capture ELISA was used to compare the antigenicity of gp120 and o-gp140 using a panel of well characterized MAbs – Abs directed against the CD4 binding site (IgGCD4 and IgG1b12) reacted slightly more strongly with the gp120 monomer than with the oligomer, as did sCD4. Srivastava *et al.* [2002]
- IgGCD4: SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447-D and 391-95D) – V2-region glycosylation site mutations did not alter neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. Ly & Stamatatos [2000]
- IgGCD4: Deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V2 but not V1 slightly enhanced neutralization by CD4BS MAb IgGCD4. Stamatatos & Cheng-Mayer [1998]
- IgGCD4: An antibody-like immunoadhesins molecule was constructed incorporating the gp120-binding domain of CD4. Capon *et al.* [1989]

- L33: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this Fab, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- L33: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
- L33: binding is sensitive to deglycosylation – heavy and light chain variable region sequence is available. Ditzel *et al.* [1995] (**antibody binding site definition and exposure**, **antibody sequence variable domain**)

- M12 database comment: There is a p15 and a gp120 mouse MAb both called M12 and a human gp41 Fab M12.
- M12: A comparison of 25 gp120 specific, conformation dependent MAbs was done – M12 is part of a group of MAbs labeled A1 – all A1 MAbs were broadly cross-reactive with gp160 from B-clade R5, X4, and R5X4 viruses, blocked CD4 binding, were sensitive to mutations in gp120 positions 368 and 370 that directly contact CD4 – 50% neutralization of NL4-3 was achieved with 21 ug/ml of M12. Sugiura *et al.* [1999]
- M12: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. Earl *et al.* [1994]

References Gorny & Zolla-Pazner 2004; Fouts *et al.* 1998; Sullivan *et al.* 1998a
Keywords enhancing activity, review

- MTW61D: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this Fab, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- MTW61D – the HIV-1 virus YU2 entry can be enhanced by MAbs binding to the CD4BS, V3 loop, and CD4i epitopes – the activation for this enhanced entry state could be conferred on HxB2 by introducing the YU2 V3 loop, or the YU2 V3 and V1/V2 loops – a similar effect is observed by sub-neutralizing concentrations of sCD4 and the effect is dependent of CCR5 – Fab fragment MTW61D also enhances YU2 entry, ruling out Fc interactions or Env cross-linking as a mechanism, while neutralizing HXBc2 – MTW61D was obtained by panning libraries derived from bone marrow from a long term asymptomatic donor against gp120 from primary isolate W61D. Sullivan *et al.* [1998a] (**enhancing activity**)

Keywords antibody binding site definition and exposure, antibody interactions, binding affinity, neutralization, review, vaccine antigen design, vaccine-specific epitope characteristics, variant cross-recognition or cross-neutralization

- b3: Molecules designed to eliminate binding by b3 while preserving epitopes of other neutralizing Abs are discussed. Lin & Nara [2007] (**review**)
- b3: This Ab was used to determine the degree to which fixation of gp120 in its CD4-bound conformation restricts antigenic recognition. b3 was not able to bind well to the stabilized gp120. Zhou *et al.* [2007] (**binding affinity**)
- b3: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. CD4BS MAbs except Fab b12 (b6, b3, F105) did not bind to either GDMR or mCHO. Selvarajah *et al.* [2005] (**vaccine antigen design**, **vaccine-specific epitope characteristics**)
- b3: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**, **review**)
- b3: This review summarizes MAbs directed to HIV-1 Env. There are 51 CD4BS MAbs and Fabs in the database; most, like this Fab, neutralize TCLA strains only. Gorny & Zolla-Pazner [2004] (**review**)
- b3: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including b3. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- b3: Alanine scanning mutagenesis was used to compare substitutions that affected anti-CD4BS NAb b12 binding to those that affect binding of sCD4 and two non-neutralizing anti-CD4BS Abs b3 and b6 – while the epitope maps overlapped, there were some differences observed – binding of CD4 was never enhanced, indicating it had evolved to be optimal – rec gp120s were engineered to contain combinations of Alanine substitutions that enhanced b12 binding, and while binding of b12 to these gp120 monomers was generally maintained or increased, binding by five non-neutralizing anti-CD4bs MAbs (b3, b6, F105, 15e, and F91) was reduced or completely abolished – 2G12 binding was largely unperturbed, indicating these proteins were not grossly misfolded. Pantophlet *et al.* [2003a] (**antibody binding site definition and exposure**)
- b3: A gp120 molecule was design to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- b3: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. Zwick *et al.* [2003] (**antibody interactions**)

B Cell

- b3: The rank order of Fab binding affinity to monomeric gp120 (Loop 2 > 3B3 > b12 = DO8i > b11 > b3 > b14 > b13 > DO142-10 > DA48 > L17) was markedly different than Fab binding affinity to the mature oligomeric form (3B3 > b12 > DO142-10 > Loop 2 > b11 > L17 > b6 > DO8i > b14 > DA48 > b3 > b13) and binding to oligomeric form and neutralization were correlated for both Fabs and MAbs – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a] (**binding affinity**)
- b3: Neutralizes TCLA strains, but not primary isolates. Parren *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)

Keywords antibody binding site definition and exposure, antibody generation, antibody interactions, binding affinity, enhancing activity, neutralization, review, subtype comparisons, vaccine antigen design, vaccine-specific epitope characteristics, variant cross-recognition or cross-neutralization

- b6: The study compared Ab neutralization against the JR-FL primary isolate and trimer binding affinities judged by native PAGE. There was direct quantitative relationship between monovalent Fab-trimer binding and neutralization, implying that neutralization begins as each trimer is occupied by one Ab. In BN-PAGE, neutralizing Fabs and sCD4 were able to shift JR-FL trimers, In contrast, most non-neutralizing Fabs, b6 in particular, bound to monomer, but their epitopes were conformationally occluded on trimers, confirming the exclusive relationship of trimer binding and neutralization. Crooks *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- b6: Five amino acids in the gp41 N-terminal region that promote gp140 trimerization (I535, Q543, S553, K567 and R588) were considered. Their influence on the function and antigenic properties of JR-FL Env expressed on the surfaces of pseudoviruses and Env-transfected cells was studied. Various non-neutralizing antibodies bind less strongly to the Env mutant, but neutralizing antibody binding is unaffected. b6 captured significantly fewer mutant pseudovirions than wild type, and b6 failed to inhibit infection by either pseudovirus. Dey *et al.* [2008] (**antibody binding site definition and exposure**, **binding affinity**)
- b6: Molecular mechanism of neutralization by MPER antibodies, 2F5 and 4E10, was studied using preparations of trimeric HIV-1 Env protein in the prefusion, the prehairpin intermediate and postfusion conformations. MAb b6 was used to analyze antigenic properties of construct 92UG-gp140-Fd, derived from isolate 92UG037.8 and stabilized by a C-terminal foldon tag. 92UG-gp140-Fd failed to bind b6, despite high affinity of b6 for 92UG-gp120 core. Frey *et al.* [2008] (**binding affinity**)
- b6: A series of peptide conjugates were constructed via click reaction of both aryl and alkyl acetylenes with an internally incorporated azidoproline 6 derived from parent peptide RINNIPWSEAMM. Many of these conjugates exhibited increase in both affinity for gp120 and inhibition potencies at both the CD4 and coreceptor binding sites. All high affinity peptides inhibited the interactions of YU2 gp120 with b6 Ab. The aromatic, hydrophobic, and steric features in the residue 6 side-chain were found important for the increased affinity and inhibition of the high-affinity peptides. Gopi *et al.* [2008]
- b6: Sera from gp120 DNA prime-protein boost immunized rabbits competed for binding to b6 while sera from rabbits immunized with protein-only regimen did not, indicating elicitation of b6-like Abs in animals immunized with DNA prime-protein boost regimen. Vaine *et al.* [2008] (**vaccine antigen design**)
- b6: SOSIP Env proteins are modified by the introduction of a disulfide bond between gp120 and gp41 (SOS), and an I559P (IP) substitution in gp41, and form trimers. The KNH1144 subtype A virus formed more stable trimers than did the prototype subtype B SOSIP Env, JRFL. The stability of gp140 trimers was increased for JR-FL and Ba-L SOSIP proteins by substituting the five amino acid residues in the N-terminal region of gp41 with corresponding residues from KNH1144 virus. b12, 2G12, 2F5, 4E10 and CD4-IgG2 all bound similarly to the WT and to the stabilized JRFL SOSIP timers, suggesting that the trimer-stabilizing substitutions do not impair the overall antigenic structure of gp140 trimers. 17b binding was induced similarly by CD4 for the WT and stabilized forms. Non-neutralizing MAbs PA-1 (V3) and b6 (CD4BS) bound less efficiently to the stabilized trimer. Dey *et al.* [2007a] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- b6: gp120 proteins with double mutation T257S+S375W, which alters the cavity at the epicenter of the CD4 binding region, had no effect on binding to b6 Ab. Dey *et al.* [2007b] (**binding affinity**)
- b6: G1 and G2 recombinant gp120 proteins, consisting of 2F5 and 4E10, and 4E10 epitopes, respectively, engrafted into the V1/V2 region of gp120, were tested as an immunogen to see if they could elicit MPER antibody responses. Deletion of V1/V2 from gp120 or its replacement with G1 and G2 grafts reduced the affinity for b6, however shortening of the N and

C termini of the V3 loop did not greatly affect binding. Law *et al.* [2007] (**vaccine antigen design**)

- b6: Molecules designed to eliminate binding by b6 while preserving epitopes of other neutralizing Abs are discussed. Lin & Nara [2007] (**review**)
- b6: This Ab was used to determine the degree to which fixation of gp120 in its CD4-bound conformation restricts antigenic recognition. b6 was not able to bind well to the stabilized gp120. Zhou *et al.* [2007] (**binding affinity**)
- b6: Macaques were immunized with SF162gp140, ΔV2gp140, ΔV2ΔV3gp140 and ΔV3gp140 constructs and their antibody responses were compared to the broadly reactive NAb responses in a macaque infected with SHIV SF162P4, and with pooled sera from humans infected with heterologous HIV-1 isolates (HIVIG). b6-like Abs were generated in the SHIV-infected macaque, and may have been present at very low titers in macaques immunized with ΔV2gp140 and ΔV2ΔV3gp140. No b6 Abs were detected in the sera from F162gp140 immunized animals. Derby *et al.* [2006] (**antibody binding site definition and exposure**, **antibody generation**)
- b6: In addition to gp120-gp41 trimers, HIV-1 particles were shown to bear nonfunctional gp120-gp41 monomers and gp120-depleted gp41 stumps on their surface. b6 did not neutralize wildtype virus but it was shown to bind to gp12-gp41 monomers. Monomer binding did not correlate with neutralization, but it did correlate with virus capture. b6 blocked b12 binding to monomeric Env but not to trimeric Env. It is hypothesized that the nonfunctional monomers on the HIV-1 surface serve to divert the Ab response helping it to avoid neutralization. Moore *et al.* [2006] (**antibody binding site definition and exposure**, **neutralization**)
- IgG1b6: JR-FL and YU2 HIV-1 strains were not neutralized by IgG1b6. IgG1b6 and other non-neutralizing Abs only recognized JR-FL cleavage-defective glycoproteins, while the neutralizing Abs (2G12 and IgG1b12) recognized both cleavage competent and cleavage-defective glycoproteins. It is suggested that an inefficient env glycoprotein precursor cleavage exposes non-neutralizing determinants, while only neutralizing regions remain accessible on efficiently cleaved spikes. For YU2, both cleavage-competent and -defective glycoproteins were recognized by both neutralizing and non-neutralizing Abs. IgG1b6, along with other Abs able to neutralize lab-adapted isolates, displayed enhanced viral entry at higher Ab concentrations, whereas the Abs that cannot neutralize any virus did not display such enhancement. Pancera & Wyatt [2005] (**antibody binding site definition and exposure**, **enhancing activity**, **neutralization**, **binding affinity**)
- b6: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. CD4BS MAbs except Fab b12 (b6, b3, F105) did not bind to either GDMR or mCHO. Selvarajah *et al.* [2005] (**vaccine antigen design**, **vaccine-specific epitope characteristics**)
- b6: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**, **review**)
- b6: 93 viruses from different clades were tested for their neutralization cross-reactivity using a panel of HIV antibodies. b6 was included as an example of a CD4BS antibody that is not strongly neutralizing, and it only was able to neutralize a few highly sensitive primary viruses and T-cell adapted viral strains that were B clade. Steric restrictions probably block its binding site in most isolates. Binley *et al.* [2004] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- b6: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including b6. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- b6: Alanine scanning mutagenesis was used to compare substitutions that affected anti-CD4BS NAb b12 binding to those that affect binding of sCD4 and two non-neutralizing anti-CD4BS Abs b3 and b6 – while the epitope maps overlapped, there were some differences observed – binding of CD4 was never enhanced, indicating it had evolved to be optimal – rec gp120s were engineered to contain combinations of Alanine substitutions that enhanced b12 binding, and while binding of b12 to these gp120 monomers was generally maintained or increased, binding by five non-neutralizing anti-CD4bs MAbs (b3, b6, F105, 15e, and F91) was reduced or completely abolished – 2G12 binding was largely unperturbed, indicating these proteins were not grossly misfolded. Pantophlet *et al.* [2003a]
- b6: A gp120 molecule was design to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- b6: Virion capture assays are not a good predictor of neutralization, and the presentation of epitopes using this assay seems to be different from that of functional Envelope spikes on primary isolates – F105 and b6 could efficiently block the b12-mediated capture of infectious virions in a virus capture, but did not inhibit b12 neutralization – while b12 was potent at neutralizing the three primary virions JR-CSF, ADA, and 89.6, the Abs F105, 19b, and Fab b6 were overall very poor neutralizers. Poignard *et al.* [2003]

B Cell

- b6: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the CD4BS MAbs used. Zwick *et al.* [2003] (**antibody interactions**)
- b6: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar. Enthalpy and entropy changes were divergent, but compensated. Not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs (17b, 48d, 1.5e, b6, F105 and F91) had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, but the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. The high values suggest surface burial or protein folding an ordering of amino acids. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)
- b6: The rank order of Fab binding affinity to monomeric gp120 (Loop 2 > 3B3 > b12 = DO8i > b11 > b3 > b14 > b13 > DO142-10 > DA48 > L17) was markedly different than Fab binding affinity to the mature oligomeric form (3B3 > b12 > DO142-10 > Loop 2 > b11 > L17 > b6 > DO8i > b14 > DA48 > b3 > b13) and binding to oligomeric form and neutralization were correlated for both Fabs and MAbs – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a]

- 17b database comment: 48d and 17b have similar epitopes, and the pair are unique among human and rodent MAbs. (**antibody binding site definition and exposure**)
- 17b: NIH AIDS Research and Reference Reagent Program: 4091.
- 17b: Five amino acids in the gp41 N-terminal region that promote gp140 trimerization (I535, Q543, S553, K567 and R588) were considered. Their influence on the function and antigenic properties of JR-FL Env expressed on the surfaces of pseudoviruses and Env-transfected cells was studied. Various non-neutralizing antibodies bind less strongly to the Env mutant, but neutralizing antibody binding is unaffected. 17b captured both pseuduvirion preparations weakly in the absence of sCD4, but its binding was increased when sCD4 was also present. 17b failed to inhibit infection by either pseudovirus. Dey *et al.* [2008] (**binding affinity**)
- 17b: Requirements for elicitation of CD4i Abs were examined by immunizing non-primate monkeys, rabbits, and human-CD4 transgenic (huCD4) rabbits with trimeric gp140. The trimers were well recognized by 17b in the absence of CD4 but the relative binding affinity increased 2-5-fold in the presence of sCD4. The avidity of the trimers for 17b in the absence of CD4 was determined to be in the low nanomolar range. Sera from immunized monkeys were able to inhibit 17b binding at a 10-fold higher dilution than sera from immunized rabbits. 17b could bind to the gp140 trimers bound to cell-surface CD4 as well, confirming that the co-receptor site is accessible after trimer binding to membrane-bound CD4. Forsell *et al.* [2008] (**antibody binding site definition and exposure**, **binding affinity**)
- 17b: Variable domains of three heavy chain Abs, the VHH, were characterized. The Abs were isolated from llamas, who produce immunoglobulins devoid of light chains, immunized with HIV-1 CRF07_BC, to gp120. It was hypothesized that the small size of the VHH, in combination with their protruding CDR3 loops, and their preference for cleft recognition and binding into active sites, may allow for recognition of conserved motifs on gp120 that are occluded from conventional Abs.17b provided some inhibition of binding of the three neutralizing VHH Abs to gp120, suggesting that 17b imposes steric hinderance to binding of the VHH Abs to gp120. Forsman *et al.* [2008] (**antibody interactions**)
- 17b: Molecular mechanism of neutralization by MPER antibodies, 2F5 and 4E10, was studied using preparations of trimeric HIV-1 Env protein in the prefusion, the prehairpin intermediate and postfusion conformations. MAb 17b was used to analyze antigenic properties of construct 92UG-gp140-Fd, derived from isolate 92UG037.8 and stabilized by a C-terminal foldon tag. Uncleaved 92UG-gp140-Fd binds 17b, but only in the presence of CD4. Frey *et al.* [2008] (**binding affinity**)

B Cell

- 17b: A series of peptide conjugates were constructed via click reaction of both aryl and alkyl acetylenes with an internally incorporated azidoproline 6 derived from parent peptide RINNIPWSEAMM. Many of these conjugates exhibited increase in both affinity for gp120 and inhibition potencies at both the CD4 and coreceptor binding sites. All high affinity peptides inhibited the interactions of YU2 gp120 with 17b Ab. Inhibition was found to be concentration-dependent. The aromatic, hydrophobic, and steric features in the residue 6 side-chain were found important for the increased affinity and inhibition of the high-affinity peptides. No inhibition of gp120 binding to 17b was observed for position 7 homoalanine-derived conjugates. Gopi *et al.* [2008]
- 17b: A mathematical model was developed and used to derive transmitted or founder Env sequences from individuals with acute HIV-1 subtype B infection. All of the transmitted or early founder Envs were resistant to neutralization by 17b, while Envs from three chronically infected patients were unusually sensitive to neutralization by 17b. This indicated that the coreceptor binding surfaces on transmitted/founder Envs are conformationally masked. Keele *et al.* [2008] (**neutralization**, **acute/early infection**)
- 17b: Three-dimensional structures of trimeric Env displayed on native HIV-1 in complex with CD4 and the Fab fragment of 17b were compared to the unligated state, using cryo-electron tomography combined with three-dimensional image classification and averaging. Binding of 17b and CD4 resulted in dramatic conformational changes, including lever-like opening of the trimer. Binding of CD4 made way for exposure of gp41 stalk, and the V3 region was released from the lateral edge of the spike to point towards the target cell. V1/V2 and CD4 binding site moved away from the centre of the spike. Liu *et al.* [2008] (**antibody binding site definition and exposure**, **structure**)
- 17b: A new purification method was developed using a high affinity peptide mimicking CD4 as a ligand in affinity chromatography. This allowed the separation in one step of HIV envelope monomer from cell supernatant and capture of pre-purified trimer. Binding of 17b to gp120SF162 purified by the miniCD4 affinity chromatography and a multistep method was comparable, suggesting that the miniCD4 allows the separation of HIV-1 envelope with intact 17b epitope. gp140DF162ΔV2 was purified by the miniCD4 method to asses its ability to capture gp140 trimers. Binding of 17b to gp140DF162ΔV2 purified by the miniCD4 affinity chromatography and a multi-step method was comparable, suggesting that the SF162 trimer antigenicity was preserved. Martin *et al.* [2008] (**assay development**, **binding affinity**)
- 1.7b: Transmission of HIV-1 by immature and mature DCs to CD4+ T lymphocytes was significantly higher for CXCR4- than for CCR5-tropic strains. Preneutralization of R5 virus with 1.7b prior to capture efficiently blocked transmission to 44%, while preineutralization of X4 virus with 1.7b had no effect, indicating that 1.7b treatment results in more efficient transfer of X4 than of R5 HIV-1. van Montfort *et al.* [2008] (**co-receptor**, **neutralization**, **dendritic cells**)
- 17b: The sensitivity of R5 envelopes derived from several patients and sevaral tissue sites, including brain tissue, lymph nodes, blood, and semen, was tested to a range of inhibitors and Abs targeting CD4, CCR5, and various sites on the HIV envelope. All but one envelopes from brain tissue were macrophage-tropic while none of the envelopes from the lymph nodes were macrophage-tropic. Macrophage-tropic envelopes were also less frequent in blood and semen. None of the patient evnelopes were inhibited by 17b, indicating that 17b epitope is not more exposed on macrophage-tropic envelopes than on non-macrophage tropic ones. Peters *et al.* [2008b] (**neutralization**)
- 17b: In order to assess whether small molecule CCR5 inhibitor resistant viruses were more sensitive to neutralization by NAbs, two escape mutant viruses, CC101.19 and D1/85.16, were tested for their sensitivity to neutralization by 17b, compared to the sensitivity of CC1/85 parental isolate and the CCcon.19 control isolate. The CC101.19 escape mutant has 4 sequence changes in V3 while the D1/85.16 has no sequence changes in V3 and relies on other sequence changes for its resistance. None of the control or resistant viruses were sensitive to neutralization by 17b. Pugach *et al.* [2008] (**co-receptor**, **neutralization**)
- 17b: Trimeric envelope glycoproteins with a partial deletion of the V2 loop derived from subtype B SF162 and subtype C TV1 were compared. The magnitude of 17b binding to subtype C trimer was lower than to subtype B trimer, either in the presence or absence of CD4. However, the fold increase in binding of 17b in presence of CD4 was similar for both subtypes, indicating similar structural rearrangements. Subtype C trimer had many biophysical, biochemical, and immunological characteristics similar to subtype B trimer, except for a difference in the three binding sites for CD4, which showed cooperativity of CD4 binding in subtype C but not in subtype B. Srivastava *et al.* [2008] (**binding affinity**, **subtype comparisons**)
- 17b: Crystal structures of CD4M47 (a derivative of a synthetic miniprotein with HIV-1 gp120 binding surface of the CD4 receptor incorporated) and a phenylalanine variant ((Phe23)M47) were determined in ternary complexes with HIV-1 gp120 and 17b Ab. The structures revealed correlation between mimetic affinity of the miniprotein for gp120 and overall mimetic-gp120 interactive surface. Stricher *et al.* [2008] (**structure**)
- 17b: An R5 HIV variant, in contrast to its parental virus, was shown to infect T-cell lines expressing low levels of cell surface CCR5 and to infect cells in the absence of CD4. The variant was seven-fold more sensitive to neutralization by 17b than the parental virus, indicating that the CCR5 binding site of gp120 is partially exposed on the mutant virus without prior binding to CD4. These properties of the mutant virus were determined by alternations in gp41. Taylor *et al.* [2008] (**co-receptor**, **neutralization**)
- 17b: The various effects that neutralizing and non-neutralizing anti-envelope Abs have on HIV infection are reviewed, such as Ab-mediated complement activation and Fc-receptor mediated activities, that both can, through various mechanisms, increase and decrease the infectivity of the virus. The importance of these mechanisms in vaccine design is discussed. The unusual features of the 17b MAb are described. Willey & Aasa-Chapman [2008] (**review**)

B Cell

- 17b: Neutralization of JRFL, ADA, and YU2 isolates by 17b increased only modestly with increased dose of sCD4, and was never above 50%, indicating that the dose of sCD4, although enough to expose the V3 region, was insufficient to induce full conformational exposure of the co-receptor binding site. Wu *et al.* [2008] (**neutralization**)
- 17b: This Ab was found to be able to bind to a highly stable trimeric rgp140 derived from a HIV-1 subtype D isolate containing intermonomer V3-derived disulfide bonds and lacking gp120/gp41 cleavage. Protein disulfide isomerase treatment of rgp120 and rgp140 was found to severely inhibit binding of 17b, suggesting a structural need for V3-derived disulfide bonds in coreceptor binding. gp140 binding to 17b was 2-fold enhanced with by sCD4, indicating the proteolytically immature protein was able to undergo CD4i conformational changes. Billington *et al.* [2007] (**antibody binding site definition and exposure**, **co-receptor**, **vaccine antigen design**)
- 17b: Macaques were immunized with either CD4, gp120, cross-linked gp120-human CD4 complex (gp120-CD4 XL), and with single chain complex containing gp120 rhesus macaque CD4 domains 1 and 2 (rhFLSC). Sera from the rhFLSC immunized animals showed highest competition titers, being able to block gp120-CD4 complex interactions with 17b more efficiently than sera from animals immunized with the three other proteins. DeVico *et al.* [2007] (**neutralization**)
- 17b: SOSIP Env proteins are modified by the introduction of a disulfide bond between gp120 and gp41 (SOS), and an I559P (IP) substitution in gp41, and form trimers. The KNH1144 subtype A virus formed more stable trimers than did the prototype subtype B SOSIP Env, JRFL. The stability of gp140 trimers was increased for JR-FL and Ba-L SOSIP proteins by substituting the five amino acid residues in the N-terminal region of gp41 with corresponding residues from KNH1144 virus. b12, 2G12, 2F5, 4E10 and CD4-IgG2 all bound similarly to the WT and to the stabilized JRFL SOSIP timers, suggesting that the trimer-stabilizing substitutions do not impair the overall antigenic structure of gp140 trimers. 17b binding was induced similarly by sCD4 in the WT and stabilized forms. Non-neutralizing MAbs PA-1 and b6 bound less efficiently to the stabilized trimer. Dey *et al.* [2007a] (**vaccine antigen design**)
- 17b: gp120 proteins with double mutation T257S+S375W, which alters the cavity at the epicenter of the CD4 binding region, showed a weak interaction with 17b in the absence of CD4 and efficient interaction with maximal 17b binding in the presence of 17b. Similar results were observed with unmodified gp120, indicating that although properly folded, the mutant proteins were not completely stabilized in the CD4-bound conformation by the two mutations.The gp120 proteins with double mutation T257S+S375W were used to immunize rabbits. The ability of rabbit sera to affect binding of CD4 to unmodified gp120 proteins was tested. CD4 binding to gp120 was enhanced by 17b. Dey *et al.* [2007b] (**binding affinity**)
- 17b: A D386N change in the V4 region, which results in restoration of N-glycosylation at this site, did not have any impact on the neutralization of a mutant virus by 17b compared to wildtype. Also, there was no association between increased sensitivity to 17b neutralization and enhanced macrophage tropism. Dunfee *et al.* [2007] (**neutralization**)
- 17b: This review summarizes data on the development of HIV-1 centralized genes (consensus and ancestral) for induction of neutralizing antibody responses. Functionality and conformation of native epitopes in proteins based on the centralized genes was tested and confirmed by binding to 17b and other MAbs. Binding of 17b following CD4 also indicated presence of functionally relevant conformational changes of the proteins. Gao *et al.* [2007] (**review**)
- 17b: HIV-1 env clones resistant to cyanovirin (CV-N), a carbohydrate binding agent, showed amino acid changes that resulted in deglycosylation of high-mannose type residues in the C2-C4 region of gp120. Compared to their parental virus HIV-1 IIIB, these resistant viruses maintained similar sensitivity to 17b, as the glycan at position 301 in the V3 loop was intact. Hu *et al.* [2007] (**neutralization**, **escape**)
- 17b: The small molecule HIV-1 entry inhibitor IC9564 significantly enhanced binding of 17b Ab to gp120 on cell surface and on viral particles. The binding was independent of the presence of soluble CD4 suggesting that IC9564 induces conformational change in gp120 that exposes the concealed 17b epitope. Significant increase in neutralizing activity of 17b in the presence of IC9564 was observed for NLDH120 and NL4-3 virus strains. In contrast to CD4, IC9564 does not induce a conformational change in gp41, and inhibits CD4-induced gp41 conformational changes. Huang *et al.* [2007b] (**antibody binding site definition and exposure**)
- 17b: Four consensus B Env constructs: full length gp160, uncleaved gp160, truncated gp145, and N-linked glycosylation-site deleted (gp160-201N/S) were compared. All were packaged into virions, and all but the fusion defective uncleaved version mediated infection using the CCR5 co-receptor. CD4 inducible MAbs 17b and E51 were tested for the ability to neutralize the various forms of Con B; as anticipated gp160 and gp145 were not neutralized by these two MAbs, but the gp160-201N/S mutant was neutralized with IC50 values of 10 ug/ml, suggesting increased formation and/or exposure of the co-receptor binding site. The poorly infectious clone WITO4160.27 was also somewhat susceptible to neutralization by these clones. Kothe *et al.* [2007] (**vaccine antigen design**, **variant cross-recognition or cross-neutralization**)
- 17b: This review summarizes 17b Ab epitope, properties and neutralization activity. The effect of differential CCR5 cell surface expression on 17b neutralization activity is discussed. Kramer *et al.* [2007] (**co-receptor**, **neutralization**, **review**)
- 17b: V3 loop deletions were introduced into three different primary HIV-1 strains: R3A, DH12, and TYBE. The deletions included: ΔV3(12,12) containing the first and the last 12 residues of the V3 loop, ΔV3(9,9) containing first and last 9 residues, and ΔV3(6,6) ontaining first and last 6 residues. Only HIV-1 R3A ΔV3(9,9) was able to support cell fusion. Passaging of this virus resulted in a virus strain (TA1) that replicated with wildtype kinetics, and that acquired several adaptive changes in gp120 and gp41 while retaining the V3 loop truncation. 17b neutralized a ΔV1/V2 virus but failed to neutralize R3A or LAI. TA1 was 100-fold more sensitive to neutralization by 17b than the ΔV1/V2 virus. Laakso *et al.* [2007] (**neutralization**)

B Cell

- 17b: 17b structure, binding, neutralization, and strategies that can be used for vaccine antigen design to elicit 17b-like Abs, are reviewed in detail. Lin & Nara [2007] (**review**, **structure**)
- 17b: A chimeric protein entry inhibitor, L5, was designed consisting of an allosteric peptide inhibitor 12p1 and a carbohydrate-binding protein cyanovirin (CNV) connected via a flexible linker. The L5 chimera inhibited 17b-gp120 interaction, but the CNV alone had a limited effect, indicating that the chimera has the high affinity binding property of the CNV molecule and the inhibitory property of the 12p1 peptide. McFadden *et al.* [2007]
- 17b: This review summarizes data on possible vaccine targets for elicitation of neutralizing Abs and discusses whether it is more practical to design a clade-specific than a clade-generic HIV-1 vaccine. Development of a neutralizing Ab response in HIV-1 infected individuals is reviewed, including data that show no apparent division of different HIV-1 subtypes into clade-related neutralization groups. The neutralizing activity of CD4i Abs, such as 17b, is discussed. McKnight & Aasa-Chapman [2007] (**review**)
- 1.7b: 1.7b-neutralized HIV-1 captured on Raji-DC-SIGN cells or immature monocyte-derived DCs (iMDDCs) was successfully transfered to CD4+ T lymphocytes, indicating that the 1.7b-HIV-1 complex was disassembled upon capture by DC-SIGN-cells. van Montfort *et al.* [2007] (**neutralization**, **dendritic cells**)
- 17b: This review provides information on the HIV-1 glycoprotein properties that make it challenging to target with neutralizing Abs. 17b neutralization properties and binding to HIV-1 envelope, and current strategies to develop versions of the Env spike with functional trimer properties for elicitation of broadly neutralizing Abs, are discussed. In addition, approaches to target cellular molecules, such as CD4, CCR5, CXCR4, and MHC molecules, with therapeutic Abs are reviewed. Phogat *et al.* [2007] (**review**)
- 17b: Viruses with V2 mutations R166K, D167N and P175L were resistant to 17b and a reduction of binding 17b to these viral variants was observed. Shibata *et al.* [2007] (**escape**, **binding affinity**)
- 17b: Chimeric VLPs, containing chimeric Con-S ΔCFI Env proteins with heterologous signal peptide (SP), transmembrane (TM), and cytoplasmic tail (CT) sequences, were all induced to bind to 17b after binding to CD4, indicating that chimeric Envs in VLPs undergo conformational changes induced by CD4. Wang *et al.* [2007a] (**antibody binding site definition and exposure**, **vaccine antigen design**, **binding affinity**)
- 17b: This Ab bound to the Fc-gp120 construct, but only weakly to the chimeras lacking the V3 loop. sCD4 restored high affinity binding to all constructs. Binley *et al.* [2006] (**binding affinity**)
- 17b: Cloned Envs (clades A, B, C, D, F1, CRF01_AE, CRF02_AG, CRF06_cpx and CRF11_cpx) derived from donors either with or without broadly cross-reactive neutralizing antibodies were shown to be of comparable susceptibility to neutralization by 17b. Cham *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 17b: Neutralization of HIV-1 primary isolates from clade B by different formats of 17b was determined in cells expressing high or low surface concentrations of CD4 and CCR5 receptors. CD4 cell surface concentration had no effect on the inhibitory activity of this Ab while the CCR5 surface concentration had a significant effect decreasing the 50% inhibitory concentration of 17b in cell lines with low CCR5. Choudhry *et al.* [2006] (**co-receptor**, **neutralization**, **variant cross-recognition or cross-neutralization**)
- 17b: Macaques were immunized with SF162gp140, ΔV2gp140, ΔV2ΔV3gp140 and ΔV3gp140 constructs and their antibody responses were compared to the broadly reactive NAb responses in a macaque infected with SHIV SF162P4, and with pooled sera from humans infected with heterologous HIV-1 isolates (HIVIG). 17b bound to SF162gp140 and ΔV3gp140 more efficiently than to ΔV2gp140 and ΔV2ΔV3gp140. The neutralization of SF162 by 17b was enhanced in a concentration-dependent manner by pre-incubation with sCD4. Derby *et al.* [2006] (**antibody binding site definition and exposure**, **neutralization**)
- 17b: The CDR3 regions of CD4i Abs (E51, 412d, 17b, C12 and 47e) were cloned onto human IgG1 and tested for their ability to inhibit CCR5 binding. Only E51 successfully immunoprecipitated gp120. Dorfman *et al.* [2006] (**co-receptor**)
- 1.7b: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- 17b: This Ab was used in a microcantilever deflection assay to detect gp120 from solution. Deflection twice that of the baseline that was detected upon specific binding of gp120 to cantilevers decorated on one side with A32 was further increased by subsequent incubation with 17b. Lam *et al.* [2006] (**assay development**, **assay standardization/improvement**)
- 17b: The gp140δCFI protein of CON-S M group consensus protein and gp140CFI and gp140CF proteins of CON6 and WT viruses from HIV-1 subtypes A, B and C were expressed in recombinant vaccinia viruses and tested as immunogens in guinea pigs. Both CD4 induced and A32 induced 17b was shown to bind specifically to all recombinant proteins except for the gp140δFI derived from subtype C virus. This Ab also bound specifically to one of the two tested subtype B gp120 proteins. The specific binding of his Ab to CON-S indicated that its conformational epitope was intact. Liao *et al.* [2006] (**antibody binding site definition and exposure**, **vaccine antigen design**, **subtype comparisons**)
- 17b: The neutralizing activity of coreceptor-binding site Abs, such as 17b, is reviewed. Pantophlet & Burton [2006] (**antibody binding site definition and exposure**, **neutralization**)
- 17b: Binding of 17b in the presence or absence of CD4 to wt gp120 and two constructs with 5 and 9 residues deleted in the middle of the beta3-beta5 loop in the C2 region of gp120 was examined. In concordance with previous studies, 17b did not bind wt gp120 in absence of CD4 but did bind it in the presence of CD4. In contrast, the two deletion constructs did not bind 17b regardless of presence or absence of CD4 indicating that the loop-deleted gp120 is unable to close up the bridging sheet and display the coreceptor site and the 17b epitope.

B Cell

Rits-Volloch *et al.* [2006] (**antibody binding site definition and exposure**, **binding affinity**)

- 17b: gp120 (monomer), gp120deltaV2 (trimer), gp140 (monomer) and gp140deltaV2 (trimer) from subtype B SF162 were expressed in cells and their affinity for 17b was assessed. All four Envs bound to 17b in the absence of CD4 but the monomers showed 3-fold higher affinity for this Ab than trimers. In the presence of CD4, the 17b epitope was upregulated in all Envs. Sharma *et al.* [2006] (**antibody binding site definition and exposure**, **binding affinity**)
- 17b: A fusion protein (FLSC R/T-IgG1) that targets CCR5 was expressed from a synthetic gene linking a single chain gp120-CD4 complex containing an R5 gp120 sequence with the hinge-Ch2-Ch3 portion of human IgG1. Binding of this protein to the CCR5 co-receptor was inhibited by MAb 17b in a dose-dependent manner. The fusion protein did not activate the co-receptor by binding, and it potently neutralized primary R5 HIV-1. Vu *et al.* [2006] (**co-receptor**)
- 17b: The G314E escape variant highly resistant to KD-247 was shown to be more sensitive to 17b Ab than the wildtype virus. 17b was shown to be able to bind and neutralize the escape virus even in the abscence of rsCD4 while rsCD4 was necessary for binding of 17b to the wildtype virus, indicating that the G314E mutation induces the expression of epitopes for Abs against CD4i epitope and V3 loop. Yoshimura *et al.* [2006] (**neutralization**, **escape**, **binding affinity**)
- 17b: Interactions of this Ab with gp120 monomer and two cleavage-defective gp140 trimers were studied. It was shown that 17b interactions with the soluble monomers and trimers were dramatically decreased by GA cross-linking of the proteins, indicating that the 17b epitope was affected by cross-linking. This Ab was associated with a large entropy change upon gp120 binding. 17b was shown to have a kinetic disadvantage as it bound to gp120 much slower than the highly neutralizing Abs 2G12 and IgG1b12. Yuan *et al.* [2006] (**antibody binding site definition and exposure**, **antibody interactions**, **kinetics**, **binding affinity**)
- 17b: The structure of the 17b MAb, particularly its CDRH3 region tyrosine sulfation, is reviewed. Also, the mechanism of its binding to the coreceptor binding site of gp120, and comparisons of the neutralizing potencies of 17b Ab fragments vs the whole IgG molecule are discussed. Engineering of Abs based on revealed structures of broadly neutralizing MAbs is discussed. Burton *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **review**, **structure**)
- 17b: Monomeric gp120 and trimeric gp140CF proteins synthesized from an artificial group M consensus Env gene (CON6) did not bind to 17b directly, but bound to it following binding to sCD4 and A32, indicating correct conformational change and subsequent exposure of the 17b epitope. Gao *et al.* [2005a] (**antibody binding site definition and exposure**, **binding affinity**)
- 17b: Called 1.7B. Of 35 Env-specific MAbs tested, only 2F5, 4E10, IgG1b12, and two CD4BS adjacent MAbs (A32 and 1.4G) and gp41 MAbs (2.2B and KU32) had binding patterns suggesting polyspecific autoreactivity, and similar reactivities may be difficult to induce with vaccines because of elimination of such autoreactivity. 1.7B has no indication of polyspecific autoreactivity. Haynes *et al.* [2005a] (**antibody binding site definition and exposure**)
- 17b: The structure of the V3 region in the context of gp120 core complexed to the CD4 receptor and to the 17b Ab was attempted to be determined by X-ray resolution, but only the structure for V3 complexed with CD4 and X5 Ab was solved. Accessibility of the co-receptor binding site to this MAb is shown in a 3D figure. Huang *et al.* [2005a] (**antibody binding site definition and exposure**, **structure**)
- 17b: Point mutations in the highly conserved structural motif LLP-2 within the intracytoplasmic tail of gp41 resulted in conformational alternations of both gp41 and gp120. The alternations did not affect virus CD4 binding, coreceptor binding site exposure, or infectivity of the virus, but did result in decreased binding and neutralization by certain MAbs and human sera. 17b exhibited similar levels of binding to both the LLP-2 mutant and wildtype viruses, indicating that sCD4 binding to the LLP-2 mutant successfully triggered conformational change of gp120 and exposure of the co-receptor binding site. Kalia *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)
- 17b: A series of genetically modified Env proteins were generated and expressed in both insect and animal cells to be monitored for their antigenic characteristics. For 17b, three of the modified proteins expressed in insect cells, including dV1V2 mutant (V1V2 deletions) followed by 3G-dV2-1G mutant (3G being mutations in three glycosylation sites and 1G being a mutation near the TM domain) and 3G-dV2 mutant, showed higher binding to the Ab than the wildtype did. This indicated that the dV1V2 mutant may expose 17b epitope better than the other Env proteins. When expressed in animal cells, only mutants 3G and dV2 showed enhanced binding to 17b but only at high concentrations of the MAb. Kang *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)
- 17b: IgG antibody phage display libraries were created from HIV-1 + individuals after pre-selection of PBMC with gp120, as an alternative to using bone marrow for generating libraries. 17b was among a set of Abs used for competition studies to define the binding sites of the newly isolated MAbs, representing a MAb with a CD4i epitope. Koefoed *et al.* [2005]
- 17b: The epitope for the MAb D19 is conserved and embedded in V3. D19 is unique in that for R5 viruses, it was cryptic and did not bind without exposure to sCD4, and for X4 and R5X4 isolates it was constitutively exposed. D19b is unqiue among CD4i antibodies in that it binds to the V3 loop. CD4i MAbs 17b and 48d were used as controls for CD4i characterization; in contrast to D19, other CD4i MAbs bind to the conserved bridging sheet and do not differentiate between R5 and X4 using strains. 17b, like D19, was able to neutralize the BaL isolate only in combination with sCD4. Lusso *et al.* [2005]
- 17b: The HIV-1 Bori-15 variant was adapted from the Bori isolate for replication microglial cells. Bori-15 had increased replication in microglial cells and a robust syncytium-forming phenotype, ability to use low levels of CD4 for infection, and increased sensitivity to neutralization by sCD4 and 17b. Four amino acid changes in gp120 V1-V2 were responsible for this change. Protein functionality and integrity of soluble, monomeric gp120-molecules derived from parental HIV-1

B Cell

Bori and microglia-adapted HIV-1 Bori-15 was assessed in ELISA binding assays using F105, IgG1b12, 17b and 48d, 2G12 and 447-52D. Association rates of sCD4 and 17b were not changed, but dissociation rates were 3-fold slower for sCD4 and 14-fold slower for 17b. Martín-García *et al.* [2005]

- 17b: R-FL and YU2 HIV-1 strains were not neutralized by 17b.17b and other non-neutralizing Abs only recognized JR-FL cleavage-defective glycoproteins, while the neutralizing Abs (2G12 and IgG1b12) recognized both cleavage competent and cleavage-defective glycoproteins. It is suggested that an inefficient env glycoprotein precursor cleavage exposes non-neutralizing determinants, while only neutralizing regions remain accessible on efficiently cleaved spikes. For YU2, both cleavage-competent and -defective glycoproteins were recognized by both neutralizing and non-neutralizing Abs.17b, along with other Abs able to neutralize lab-adapted isolates, displayed enhanced viral entry at higher Ab concentrations, whereas the Abs that cannot neutralize any virus did not display such enhancement. Pancera & Wyatt [2005] (**antibody binding site definition and exposure**, **enhancing activity**, **neutralization**, **binding affinity**)
- 17b: A stable trimerization motif, GCN4, was appended to the C terminus of YU2gp120 to obtain stable gp120 trimers (gp120-GCN4). Each trimer subunit was capable of binding IgG1b12, indicating that they were at least 85% active. D457V mutation in the CD4 binding site resulted in a decreased affinity of the gp120-GCN4 trimers for CD4 and for 17b. Both the CNG-gp120 trimers and the D457V mutants showed a restricted stochiometry to 17b of one Ab molecule binding per trimer. Removal of the V1-V2 loops resulted in binding of three 17b molecules per trimer. Pancera *et al.* [2005] (**binding affinity**, **structure**)
- 17b: Escape mutations in HR1 of gp41 that confer resistance to Enfuvirtide reduced infection and fusion efficiency and also delayed fusion kinetics of HIV-1. The mutations also conferred increased neutralization sensitivity of virus to 17b. Enhanced neutralization correlated with reduced fusion kinetics, indicating that the mutations result in Env proteins remaining in the CD4-triggered state for a longer period of time. Reeves *et al.* [2005] (**antibody binding site definition and exposure**, **drug resistance**, **neutralization**, **escape**, **HAART, ART**)
- 17b: A reverse capture assay was developed to asses what kind of human MAbs were produced in EBV B-cell transformation assays performed on PBMC sampled at different timepoints from three HIV-1 infected patients on HAART. The reverse capture assay was validated by the solid phase MAbs that could not capture biotin-MAbs of the same or overlapping specificity when reacted with patient virus envelope glycoproteins preincubated with or without sCD4. Reverse capture assay showed that the produced Abs from the patients were able to block binding of biotin-labeled 17b, indicating presence of CD4i Abs. These were the most frequently produced Abs from all three patients, suggesting that CD4i epitopes are much more immunogenic than previously appreciated. Robinson *et al.* [2005] (**antibody generation**, **assay development**, **HAART, ART**)
- 17b: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. CD4i MAbs (48d, 17b) did not bind to either GDMR or mCHO even with sCD4. Selvarajah *et al.* [2005] (**vaccine antigen design**, **vaccine-specific epitope characteristics**)
- 17b: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**, **variant cross-recognition or cross-neutralization**, **review**, **structure**)
- 17b: This review summarizes data on 447-52D and 2219 crystallographic structures when bound to V3 peptides and their corresponding neutralization capabilities. 17b, like 447-52D and like other HIV-1 neutralizing Abs, was shown to have long CDR H3 loop, which is suggested to help Abs access recessed binding sites on the virus. Stanfield & Wilson [2005] (**antibody binding site definition and exposure**, **review**, **structure**)
- 17b: A T-cell line adapted strain (TCLA) of CRF01_AE primary isolate DA5 (PI) was more neutralization sensitive to 17b than the primary isolate. Mutant virus derived from the CRF01_AE PI strain, that lacked N-linked glycosylation at position 197 in the C2 region of gp120, was significantly more sensitive to neutralization by 17b then the PI strain. Deglycosylated subtype B mutants at positions 197 and 234 were slightly more neutralizable by 17b. Teeraputon *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **subtype comparisons**)
- 17b: This Ab bound with an intermediate affinity to gp120IIIb, it did not prevent uptake of gp120 by APCs, and had no inhibitory effect on gp120 antigen presentation by MHC class II. 17b disassociated from gp120 at acidic pH. Lysosomal enzyme digestion of gp120 treated with 17b yielded fragmentation similar to that of gp120 alone, and digestion rate was intermediate, between the rapid digestion of gp120 alone and the slow digestion of gp120 in complex with high-affinity Ab5145A. It is thus concluded that CD4i Ab 17b does not have an inhibitory effect on gp120 processing and presentation. Tuen *et al.* [2005] (**antibody interactions**, **binding affinity**)
- 17b: Conformation of two gp120 constructs, gp120 bound to CD4D12 (the first two domains of human CD4), and gp120 bound to M9 (a 27-residue CD4 analog), was characterized by binding assays with Ab b17 in the presence or absence of soluble CD4D12. JRFL gp120 alone did not bind to b17 in the absence of CD4D12 but did bind in the presence of CD4D12. The gp120-CD4D12 construct bound to b17 in the absence of soluble CD4D12, and no enhancement in binding was observed when soluble CD4D12 was present, suggesting that all of the single chain was properly folded in the CD4i conforma-

tion. gp120-M9 construct also bound to 17b but with much lower affinity, and the binding was enhanced with presence of soluble CD4D12. This suggested that gp120-M9 single chain may contain both molecules where gp120 is bound to M9 in the CD4i conformation, and molecules resembling free gp120. Varadarajan *et al.* [2005] (**antibody binding site definition and exposure**, **kinetics**, **binding affinity**)

- 17b: Ab neutralization of viruses with mixtures of neutralization-sensitive and neutralization-resistant envelope glycoproteins was measured. It was concluded that binding of a single Ab molecule is sufficient to inactivate function of an HIV-1 glycoprotein trimer. The inhibitory effect of the Ab was similar for neutralization-resistant and -sensitive viruses indicating that the major determinant of neutralization potency of an Ab is the efficiency with which it binds to the trimer. It was also indicated that each functional trimer on the virus surface supports HIV-1 entry independently, meaning that every trimer on the viral surface must be bound by an Ab for neutralization of the virus to be achieved. Yang *et al.* [2005c] (**neutralization**)
- 17b: A substantial fraction of soluble envelope glycoprotein trimers contained inter-subunit disulfide bonds. Reduction of these disulfide bonds decreased binding of 17b to the glycoprotein, indicating that the inter-S-S bonds contribute to the exposure of the CD4-induced region. Yuan *et al.* [2005] (**antibody binding site definition and exposure**)
- 17b: The peptide 12p1 (RINNIPWSEAMM) inhibits direct binding of YU2 gp120 or Env trimer to CD4, CCR5 and MAb 17b in a concentration-dependent allosteric manner. 12p1 is thought to bind to unbound gp120 near the CD4 binding site, with a 1:1 stoichiometry. 12p1 also inhibited MAb F105 binding presumably because F105 favors an unactivated conformation, but not MAbs 2G12 or b12. The 1:1 stoichiometry, the fact that the peptide binding site is accessible on the trimer, the non-CD4 like aspect of the binding, and an ability to inhibit viral infection in cell cultures make it a promising lead for therapeutic design. Biorn *et al.* [2004]
- 17b: This review summarizes MAbs directed to HIV-1 Env. There are six CD4 inducible MAbs and Fabs in the database. The MAb forms neutralize TCLA strains only, but the smaller Fabs and scFv fragments can neutralize primary isolates. Gorny & Zolla-Pazner [2004] (**antibody binding site definition and exposure**, **review**)
- 17b: A32-rgp120 complexes opened up the CCR5 co-receptor binding site, but did not induce neutralizing antibodies with greater breadth among B subtype isolates than did uncomplexed rgp120 in vaccinated guinea pigs. 17b was used as a control to show A32-bound rgp120 had enhanced binding to this CD4-inducible MAb. Liao *et al.* [2004] (**vaccine antigen design**)
- 17b: The role of serine proteases on HIV infection was explored. Trypsin decreased the binding of most Env MAb tested and diminished cell fusion of H9 cells infected with HIV-1 LAI virus (H9/IIIB) to MAGI cells. In contrast, thrombin increased the binding of MAbs to gp120 epitopes near the CD4 and CCR5 binding sites, and increased cell fusion. Binding of 17b was decreased by trypsin, but increased by thrombin. Thrombin may increase HIV-induced cell fusion in blood by causing a conformational activating shift in gp120. Ling *et al.* [2004] (**antibody binding site definition and exposure**)
- 17b: Sera from two HIV+ people and a panel of MAbs were used to explore susceptibility to neutralization in the presence or absence of glycans within or adjacent to the V3 loop and within the C2, C4 and V5 regions of HIV-1 SF162 env gp120. The loss of the glycan within the V3 loop (GM299 V3) and two sites adjacent to V3, C2 (GM292 C2) and (GM329 C3), increased neutralization susceptibility to CD4i FAb X5, but each of the glycan mutants and SF162 were refractive to neutralization with 48d and 17b. The loss of sites in C4 (GM438 C4), or V5 (GM454 V5) did not increase neutralization susceptibility to FAb X5. V3 glycans tended to shield V3 loop, CD4 and co-receptor MAb binding sites, while C4 and V5 glycans shielded V3 loop, CD4, gp41 but not co-receptor MAb binding sites. Selective removal of glycans from a vaccine candidate may enable greater access to neutralization susceptible epitopes. McCaffrey *et al.* [2004] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- 17b: A set of HIV-1 chimeras that altered V3 net charge and glycosylation patterns in V1V2 and V3, involving inserting V1V2 loops from a late stage primary isolate taken after the R5 to X4 switch, were studied with regard to phenotype, co-receptor usage, and MAb neutralization. The loops were cloned into a HXB2 envelope with a LAI viral backbone. It was observed that the addition of the late-stage isolate V1V2 region and the loss of V3-linked glycosylation site in the context of high positive charge gave an X4 phenotype. R5X4, R5, and X4 viruses were generated, and sCD4, 2G12 and b12 neutralization resistance patterns were modified by addition of the late stage V1V2, glycosylation changes, and charge in concert, while neutralization by 2F5 was unaffected. 15e, 17b, and 48d could not neutralize any of the variants tested. Nabatov *et al.* [2004] (**antibody binding site definition and exposure**, **co-receptor**)
- 17b: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including 17b. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- 17b: V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neturalization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12 which neutralized both strains), neutralized the SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype. Three CD4i MAbs were tested; all preferentially neutralized SF162, and JRFL became neutralization sensitive to CD4i Abs if the SF162 V1V2 loop was exchanged. Pinter *et al.* [2004] (**variant cross-recognition or cross-neutralization**)

B Cell

- 17b: The SOS mutant envelope protein introduces a covalent disulfide bond between gp120 surface and gp41 transmembrane proteins into the R5 isolate JR-FL by adding cysteines at residues 501 and 605. Pseudovirions bearing this protein bind to CD4 and co-receptor bearing cells, but do not fuse until treatment with a reducing agent, and are arrested prior to fusion after CD4 and co-receptor engagement. CD4i Abs 17b and X5 were weakly neutralizing in all formats, WT, SOS, and when added postbinding. Binley *et al.* [2003] (**vaccine antigen design**)
- 17b: Called 1.7b. The MAb B4e8 binds to the base of the V3 loop, neutralizes multiple primary isolates and was studied for interaction with other MAbs. B4e8 enhanced binding of CD4i MAbs 4.8d, 1.7b, and A1g8 to R5X4 virus 92HT593, but only of 48d to the R5 virus 92US660, and there was only a modest impact of the combination of B4e8 and CD4i MAbs on neutralization. Cavacini *et al.* [2003] (**antibody interactions**, **co-receptor**)
- 17b: 17b was used as a negative control to test CDR3 tyrosine sulfation of MAbs 47e, 412d, CM51, E51, C12 and Sb1, since its CDR3 tyrosines are buried. As expected, 17b did not incorporate sulfates while the other MAbs did. Thus, the experssion of 17b, or its binding to gp120 bound to CD4-Ig, was not affected by sulfation-inhibition. In addition, 17b was used as a positive control to test whether MAbs 47e, 412d, E51, Sc1 and C12 are CD4i Abs. Binding efficiency of all MAbs to ADA gp120 was doubled in the presence of CD4, showing that they are CD4-induced. scFv 17b was shown to efficiently bind to gp120 of three R5 isolates and to the HXBc2 X4 isolate. Neutralization assays showed that 17b was less efficient at neutralizing primary R5 and R5X4 isolates than MAbs 412d and E51, however, it was more efficient at neutralizing X4 isolates than these MAbs. Choe *et al.* [2003] (**antibody binding site definition and exposure**, **neutralization**)
- 17b: A sCD4-17b single chain chimera was made that can bind to the CD4 binding site, then bind and block co-receptor interaction. This chimeric protein is a very potent neutralizing agent, more potent than IgG1b12, 2G12 or 2F5 against Ba-L infection of CCR5-MAGI cells. It has potential for prophylaxis or therapy. It neutralized 5/6 R5 and X4 strains from the B clade, but was only moderately protective against a D clade isolate, and did not neutralize clade A, C, E, and F isolates. Dey *et al.* [2003] (**co-receptor**, **immunoprophylaxis**, **variant cross-recognition or cross-neutralization**, **immunotherapy**, **subtype comparisons**)
- 17b: 17b is known to be comprised of elements from four discontinuous beta strands. Using 17b MAb to select peptides from a combinatorial library, and analyzing the peptides using a novel discontinuous epitope reconstruction program, enabled epitope prediction. Segments of gp120 were reconstructed as an antigenic protein mimetic recognized by 17b. Comparisons then were made with a similar prediction of contact residues for CG10, a CD4i MAb that competes with 17b, but has a distinct binding site. Enshell-Seijffers *et al.* [2003] (**antibody binding site definition and exposure**, **mimotopes**, **computational epitope prediction**)
- 17b: Vaccination of a gp120-CD4 fusion complex in six transgenic XMG2 XenoMouse mice that produce human IgG2 with K light chain did not produce any neutralizing antibodies. 36/39 MAbs derived from one of these mice were in one of two competition groups that were conformational and specific for the complex, suggesting this chimeric vaccine may be of little value, as immunodominant responses recognized epitopes not present in native Env. MAbs from the two CD4-gp120 complex-specific competition groups did not compete with MAbs with known targets on HIV-1 gp120, but their binding was enhanced by binding of 17b. He *et al.* [2003]
- 17b: This study shows the fragments of CD4i MAbs are better able to neutralize virus than whole IgG. Neutralization of HIV-1 R5 isolates JRFL, JR-CSF and ADA by CD4i MAbs X5, 17b, and 48d decreased with increased molecule size, the neutralizing potency of single-chain Fv (scFv) > than Fab fragments > whole Ab molecules. (With the exception of IgG 48d neutralization of HIV-1 ADA.) HIV-1 X4 isolates 89.6 and HxB2 are both relatively sensitive even to the larger IgG version. R5X4 isolate neutralization was dependent on the isolate and co-receptor usage. The CD4i MAb fragments neutralize HIV-1 subsequent to CD4 binding. The CD4i MAbs bind near the co-receptor binding sites on gp120. Co-receptors bind to the conserved beta19 strand and part of the V3 loop, regions that are masked by the V1V2 loops in the CD4-unbound state. When CD4 is bound, the co-receptor site is exposed near the membrane surface where it would be optimally accessible to co-receptors, and the smaller versions of the molecules are better able to overcome the steric hindrence. Labrijn *et al.* [2003] (**antibody binding site definition and exposure**, **co-receptor**, **variant cross-recognition or cross-neutralization**)
- 17b: Env genes derived from uncultured brain biopsy samples from four HIV-1 infected patients with late-stage AIDS were compared to env genes from PBMC samples. Brain isolates did not differ in the total number or positions of N-glycosylation sites, patterns of coreceptor usage, or ability to be recognized by gp160 and gp41 MAbs. 17b recognized most variants,some from each of the four individuals, by gp120 immunoprecipitation. Ohagen *et al.* [2003] (**brain/CSF**, **variant cross-recognition or cross-neutralization**)
- 17b: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- 17b: This paper describes the generation of CD4i MAb E51, that like CD4i MAb 17b, blocks CCR5 binding to sCD4-bound gp120. E51 has more cross-neutralizing potency than other prototype CD4i MAbs (17b) for B and C clade isolates. E51 and 17b both neutralized HIV-1 clade B strains HXBc2 and ADA, while JR-FL and 89.6 were only neutralized by E51, not 17b. Clade C strains MCGP1.3 and SA32 were both inhibited by 17b and E51, but E51 was more potent against SA32. The substitutions E381R, F383S, R419D I420R, K421D, Q422L, I423S, and Y435S (HXB2 numbering) all severely reduce 17b and E51 binding. All but I423S also diminish CCR5 binding by more than 50%. The mutation F383S also inhibits sCD4 binding and F105 binding,

B Cell

and K421D inhibits F105 binding, but not sCD4. Xiang *et al.* [2003] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)

- 17b: The HIV-1 primary isolate DH012 has preserved the epitopes for the MAbs IgG1b12, 2G12, 17b, however natural DH012 infection in chimpanzees and DH012 gp120 vaccination in guinea pigs does not give rise to Abs against these epitopes. Zhu *et al.* [2003] (**vaccine-specific epitope characteristics**)
- 17b: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a CD4i MAb that had no impact on 4KG5 binding. Zwick *et al.* [2003] (**antibody interactions**)
- 17b: The two N-terminal domains of CD4, termed D1 and D2, when expressed in the absence of the remaining domains of CD4 retain the capacity to bind to gp120—coding sequences of D1D2 and Igαtp were fused to create a large, multivalent rec protein D1D2Igαtp, which, unlike CD4, does not enhance infection at sub-optimal concentrations—the MAb 17b can also enhance viral replication at sub-optimal concentrations, but D1D2-Igα inhibited the 17b enhancement of two primary isolates. Arthos *et al.* [2002] (**variant cross-recognition or cross-neutralization**)
- 17b: gp120 mutants were used to define the CXCR4 binding site using CXCR4 displayed on paramagnetic proteoliposomes (PMPLs) to reduce non-specific gp120 binding—basic residues in the V3 loop and the β19 strand (RIKQ, positions 419-422) were involved, and deletion of the V1-V2 loops allowed CD4-independent CXCR4 binding—MAbs 17b (CD4i) and F105 (CD4BS) were used to study conformational changes in the mutants—the affinity of ΔV1 and ΔV1-V2 for 17b was dramatically increased and no longer inducible in the presence of sCD4—V3 mutants R298A and R327A were not recognized by 17b except in the presence of sCD4—mutations in the β19 strand dramatically reduced 17b affinity in the presence or absence of sCD4, consistent with known 17b contact residues in this region. Basmaciogullari *et al.* [2002]
- 17b: This study examined antibody interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4 isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate. Anti-V3 MAb B4a1 increased binding of CD4i MAbs 48d, 17b and A1g8, but only A1g8 binding was increased by B4a1 to the R5 isolate. Additive affects on neutralizaton of the R5X4 isolate with B4a1 and CD4i MAbs was observed, presumably due to increased exposure of the CD4i binding site, but not for the R5 isolate. Anti-gp41 MAb F240 had a synergistic effect on neutralization with CD4i MAbs 48d and 17b, but not with A1g8 for the R5X4 virus. Cavacini *et al.* [2002] (**antibody interactions**, **co-receptor**, **variant cross-recognition or cross-neutralization**)
- 17b: CD4 residue Phe43 significantly contributes to the affinity of CD4-gp120 interactions – despite decreased affinities for gp120, CD4 proteins and CD4-mimetic peptides lacking a Phe side-chain enhance binding of gp120 to 17b in a manner similar to Phe-bearing ligands indicating the Phe42 interaction is not critical for CD4-induced conformational changes in gp120. Dowd *et al.* [2002]
- 17b: Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. Edwards *et al.* [2002] (**vaccine-specific epitope characteristics**)
- 17b: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I and Cluster II MAbs required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor, binding to a fusion intermediate. 17b was used to demonstrate that the Cluster I and II MAbs bound to gp120/gp41 complexes, not to gp41 after shedding of gp120. Finnegan *et al.* [2002]
- 17b: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – the preincubation 31.5 C step did not alter the inhibitory activity of neutralizing Abs anti-gp41 2F5, or anti-gp120 2G12, IG1b12, 48d, and 17b. Golding *et al.* [2002b]
- 17b: HIV-1 gp160ΔCT (cytoplasmic tail-deleted) proteoliposomes (PLs) containing native, trimeric envelope glycoproteins from R5 strains YU2 and JRFL, and X4 strain HXBc2, were made in a physiologic membrane setting as candidate immunogens for HIV vaccines—2F5 bound to gp160ΔCT with a reconstituted membrane ten-fold better than the same protein on beads—anti-CD4BS MAbs IgG1b12 and F105, A32 (C1-C4), C11 (C1-C5), and 39F (V3) MAbs bound gp160ΔCT PLs indistinguishably from gp160ΔCT expressed on the cell surface—non-neutralizing MAbs C11 and A32 bound with lower affinity than NAb IgG1b12—the MAb 17b was sCD4 inducible on gp160ΔCT PL. Grundner *et al.* [2002] (**vaccine antigen design**)
- 17b: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar. Enthalpy and entropy changes were divergent, but compensated. Not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs (17b, 48d, 1.5e, b6, F105 and F91) had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120

B Cell

monomer, but the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. The high values suggest surface burial or protein folding an ordering of amino acids. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)

- 17b: A pseudotyping assay showed that an X4 V3 loop peptide could enhance infectivity of X4 virus, R5 and R5X4 V3 loops peptides could enhance infectivity of an R5 virus, and R5X4 peptides could enhance infectivity of an R5X4 virus. Neither R5 nor R5X4 peptides influenced binding of CD4BS MAbs F105 and Ig1Gb12, but did increase binding of CD4i MAb 17b. Ling *et al.* [2002] (**antibody binding site definition and exposure**, **co-receptor**)
- 17b: Ab binding characteristics of SOS gp140 were tested using SPR and RIPA – SOS gp140 is gp120-gp41 bound by a disulfide bond – NAbs 2G12, 2F5, IgG1b12, CD4 inducible 17b, and 19b bound to SOS gp140 better than uncleaved gp140 (gp140unc) and gp120 – non-neutralizing MAbs 2.2B (binds to gp41 in gp140unc) and 23A (binds gp120) did not bind SOS gp140. Schulke *et al.* [2002] (**vaccine antigen design**)
- 17b: Oligomeric gp140 (o-gp140) derived from R5 primary isolate US4 was characterized for use as a vaccine reagent – antigen capture ELISA was used to compare the antigenicity of gp120 and o-gp140 using a panel of well characterized MAbs – 17b recognized both gp120 monomer and o-gp140. Srivastava *et al.* [2002]
- 17b: A series of mutational changes were introduced into the YU2 gp120 that favored different conformations – 375 S/W seems to favor a conformation of gp120 closer to the CD4-bound state, and is readily bound by sCD4 and CD4i MAbs (17b, 48d, 49e, 21c and 23e) but binding of anti-CD4BS MAbs (F105, 15e, IgG1b12, 21h and F91 was markedly reduced – IgG1b12 failed to neutralize this mutant, while neutralization by 2G12 was enhanced – 2F5 did not neutralize either WT or mutant, probably due to polymorphism in the YU2 epitope – another mutant, 423 I/P, disrupted the gp120 bridging sheet, favored a different conformation and did not bind CD4, CCR5, or CD4i antibodies, but did bind to CD4BS MAbs. Xiang *et al.* [2002b] (**variant cross-recognition or cross-neutralization**)
- 17b: Five CD4i MAbs were studied, 17b, 48d and three new MAbs derived by Epstein-Barr virus transformation of PBMC from an HIV+ long term non-progressor – 23e and 21c were converted to hybridomas to increase Ab production – all compete with the well-characterized 17b CD4i MAb in an ELISA antigen capture assay – critical binding residues are mapped and the CD4i MAb epitopes were distinct but share a common element near isoleucine 420, also important for CCR5 binding, and all five can block CCR5 binding to a sCD4-gp120 complex – the MAb 48d has the epitope most similar to the CCR5 binding site. Xiang *et al.* [2002a] (**antibody binding site definition and exposure**)
- 17b: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin—stabilized oligomer gp140Δ683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and C11, A32, and 30D which did not bind the stabilized oligomer. Yang *et al.* [2002]
- 17b: A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002]
- 17b: Using a cell-fusion system, it was found CD4i antibodies 17b, 48d, and CG10 reacted faintly with Env expressing HeLA cells even in the absence of sCD4 or CD4 expressing target cells. Reactivity increased after sCD4 addition, but not after CD4 expressing target cell addition, and binding was not increased at the cell-to-cell CD4-Env interface. This suggests the CD4i co-receptor binding domain is largely blocked at the cell-fusion interface, and so CD4i antibodies would not be able access this site and neutralize cell-mediated viral entry. Finnegan *et al.* [2001]
- 17b: Mutations in two glycosylation sites in the V2 region of HIV-1 ADA at positions 190 and 197 (187 DNTSYR-LINCNTS 199) cause the virus to become CD4-independent and able to enter cells through CCR5 alone—these same mutations tended to increase the neutralization sensitivity of the virus, including to 17b—only the CD4i antibodies 17b and 48d showed an increased affinity of the CD4 independent viruses relative to wild-type. Kolchinsky *et al.* [2001] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 17b: Structural aspects of the interaction of neutralizing Abs with HIV-1 Env are reviewed – Env essentially has three faces, one is largely inaccessible on the native trimer, and two that exposed but have low immunogenicity on primary viruses – neutralization is suggested to occur by inhibition of the interaction between gp120 and the target cell membrane receptors as a result of steric hindrance and it is noted that the attachment of approximately 70 IgG molecules per virion is required for neutralization, which is equivalent to about one IgG molecule per spike – the 2G12, 17b and b12 epitopes are discussed in detail – the 17b epitope is masked prior to CD4 binding by the V1-V2 loop and in contrast to sCD4, the binding of cell surface CD4 to virus does not appear to make the epitope accessible to binding by 17b to allow neutralization. Poignard *et al.* [2001] (**antibody binding site definition and exposure**, **review**)
- SHIV-HXBc2 is a neutralization sensitive non-pathogenic virus, and several <i>in vivo</i> passages through monkey's

yielded highly pathogenic SHIV KU-1 – HXBc2 and the KU-1 clone HXBc2P3.2 differ in 12 amino acids in gp160 – substitutions in both gp120 and gp41 reduced the ability of sCD4, IgG1b12, F105 and AG1121 to Env achieve saturation and full occupancy, and neutralize KU-1 – 17b and 2F5 also bound less efficiently to HXBc2P3.2, although 2G12 was able to bind both comparably. Si *et al.* [2001] (**variant cross-recognition or cross-neutralization**)

- 17b: Abs against the V3 loop (50.1, 58.2, 59.1, 257-D, 268-D, 447-52D), CD4BS (IgG1b12, 559-64D, F105), CD4i (17b), and to gp41 (2F5, F240) each showed similar binding efficiency to Env derived from related pairs of primary and TCLA lines (primary: 168P and 320SI, and TCLA: 168C and 320SI-C3.3), but the TCLA lines were much more susceptible to neutralization suggesting that the change in TCLA lines that make them more susceptible to NAbs alters some step after binding – 17b bound at somewhat greater levels to 168C than to 168P, but this is not a general feature of 17b binding to primary versus TCLA strains. York *et al.* [2001] (**variant cross-recognition or cross-neutralization**)
- 17b: 17b binds to a CD4 inducible epitope which partially overlaps the CCR5 binding site – JRFL, YU2, 89.6, and HXB2 and their C1-, V1/V2-, C5 -deletion mutants were used to study how 17b binding affects gp120-CD4 interactions – 17b reduced CD4-gp120 interactions by decreasing the on-rate and increasing the off-rate of sCD4, while enhanced binding of sCD4 binding was observed for the 17b-bound, V1/V2 deleted gp120s – 17b was considered to be a surrogate for CCR5, and the authors suggest that 17b binding may shift V1/V2 into a position that interferes with CD4 binding, forcing a release. Zhang *et al.* [2001a] (**antibody binding site definition and exposure**, **kinetics**)
- 17b: To determine the antigenicity of virus killed by thermal and chemical inactivation, retention of conformation-dependent neutralization epitopes was examined, and exposure of CD4BS epitopes was found to be enhanced (MAbs IgG1b12, 205-46-9, and 205-43-1) – binding to 2G12 and 447-52D epitopes was essentially unaltered – the 17b CD4i epitope was also exposed. Grovit-Ferbas *et al.* [2000] (**vaccine antigen design**)
- 17b: SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447-D and 391-95D) – V2-region glycosylation site mutations did not alter neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. Ly & Stamatatos [2000] (**variant cross-recognition or cross-neutralization**)
- 17b: Six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. Park *et al.* [2000] (**antibody binding site definition and exposure**)
- 17b: Mutagenesis defines Ile-420, Lys-421, Gln-422, Pro-438, and Gly-441 to be important residues for CCR5 binding – these positions are located on two strands that connect the gp120 bridging sheet and outer domain, suggesting a mechanism for conformational shifts induced by CD4 binding to facilitate CCR5 binding. Rizzuto & Sodroski [2000] (**antibody binding site definition and exposure**)
- 17b: sCD4 can activate fusion between effector cells expressing Env and target cells expressing coreceptor (CCR5 or CXCR4) alone without CD4 – CD4i MAbs 17b and 48d have little effect on a standard cell fusion assay but potently block sCD4 activated fusion – 17b was broadly cross-reactive inhibiting sCD4 activated fusion with Env from clades A, B, C, D, E, F, and F/B. Salzwedel *et al.* [2000] (**subtype comparisons**)
- 17b: Soluble gp140 derived from SF162, a neutralization-resistant primary isolate, and SF162AV2 a neutralization-susceptible isolate with 30 amino acids deleted from the V2 loop, were generated with or without the gp120-gp41 cleavage site intact – all forms are recognized by oligomer-specific MAb T4 and show enhanced binding of CD4i MAb 17b when sCD4 is bound – the fused forms are less efficiently recognized than the cleaved forms by polyclonal neutralizing sera from HIV-infected patients – the V3 loop is more exposed on the fused form. Stamatatos *et al.* [2000] (**vaccine antigen design**)
- 17b: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. Yang *et al.* [2000] (**vaccine antigen design**)
- 17b: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. Binley *et al.* [1999] (**vaccine antigen design**)
- 17b: A CD4-independent viral variant of IIIB, IIIBx, was generated on CXCR4-expressing cells – IIIBx exhibited greater

B Cell

exposure of the 17b and 48d epitopes and enhanced neutralization by CD4i MAbs and by polyclonal human sera – the 17b epitope has significant overlap with the CCR5 coreceptor binding site. Hoffman *et al.* [1999] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)

- 17b: A panel of MAbs was shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer – CD4i MAbs 17b and 48d bound better to the deleted protein than to wild type. Binley *et al.* [1998] (**antibody binding site definition and exposure**)
- 17b: 17b Fab was co-crystallized with a gp120 core and CD4, and it's binding site can be directly visualized—17b binds to the "bridging sheet" of gp120, an antiparallel beta sheet region, contacting residues from the C4 region and the V1/V2 stem—the contact area is small for an Ab-antigen interactive surface, and dominated in the Ab by the heavy chain—the center of the binding region has hydrophobic interactions, and the periphery charge interactions, acidic on 17b and basic on gp120. Kwong *et al.* [1998] (**structure**)
- 17b: Moore and Binley provide a commentary on the papers by <cite>Rizzuto1998</cite>, <cite>Wyatt1998</cite> and <cite>Kwong1998</cite> – they point out 17b shares binding elements in gp120 with chemokine receptor molecules, and that CD4 needs to bind to gp120 first to make the 17b epitope accessible and it may be sterically blocked in the CD4 bound virus, thus making it a poor NAb for primary isolates <cite>Moore1998</cite>. Kwong *et al.* [1998]; Moore & Binley [1998]; Rizzuto *et al.* [1998]; Wyatt *et al.* [1998] (**review**, **structure**)
- 17b: Site directed mutagenesis of a WU2 protein with the V1-V2 loops deleted revealed key residues for 17b-gp120 interaction and interaction of gp120 and CCR5 – mutations in residues that reduced 17b by 70% were R/D 419, I/R 420, Q/L 422, Y/S 435, I/S 423, K/D 121 and K/D 421– 17b can neutralize HIV-1 strains that use different chemokine receptors, supporting a common region in gp120 in chemokine-receptor interaction. Rizzuto *et al.* [1998] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 17b: Deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V2 but not V1 enabled neutralization by CD4i MAbs 17b and 48d. Stamatatos & Cheng-Mayer [1998] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- 17b: sCD4 induces 17b binding in primary isolates and TCLA strains – amino acids that reduce the efficiency of binding were determined and found also to compromise syncytia formation and viral entry – V1V2 deletion or sCD4 binding can expose the 17b epitope for both HXBc2 and macrophage tropic YU2 – neutralizing potency of 17b is probably weak due to poor exposure of the epitope – 17b epitope exposure upon sCD4 binding can occur over a wide range of temperatures, consistent with the energy of CD4 binding being sufficient to drive the V1/V2 loop into a new conformation. Sullivan *et al.* [1998b] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 17b: The HIV-1 virus YU2 entry can be enhanced by MAbs binding to the CD4BS, V3 loop, and CD4i epitopes – the activation for this enhanced entry state could be conferred on HxB2 by introducing the YU2 V3 loop, or the YU2 V3 and V1/V2 loops, and the presence of V1/V2 increased the enhancement – a similar effect is observed by sub-neutralizing concentrations of sCD4 and the effect is dependent of CCR5 – 17b enhances YU2 enhanced viral entry 10-fold, whereas HXBc2 was neutralized. Sullivan *et al.* [1998a]
- 17b: Summary of the implications of the crystal structure of a gp120 core bound to CD4 and 17b, combined with what is known about mutations that reduce NAb binding to gp120 – probable mechanism of neutralization is interference with chemokine receptor binding – mutations in 88N, 117K, 121K, 256S, 257T, N262, Delta V3, E370, E381, F 382, R 419, I 420, K 421, Q 422, I 423, W 427, Y 435, P 438, M 475 of HXBc2 (IIIB) reduce binding – the only variable residues in gp120 that contact 17b are 202T and 434M – the contact points for 17b with the crystallized incomplete gp120 are mostly in the heavy chain of the Ab, and there is a gap between 17b's light chain and the partial gp120 which may be occupied by the V3 loop in a complete gp120 molecule – the authors propose that the V2 and V3 loops may mask the CD4i Ab binding site, and that the V2 loop may be repositioned upon CD4 binding. Wyatt *et al.* [1998] (**structure**)
- 17b: Virus with the V1-V2 loop deleted was viable and more susceptible to neutralization by CD4i MAb 17b, and anti-V3 MAbs 1121, 9284, and 110.4, but not to a CD4BS MAb, F105, or sCD4. Cao *et al.* [1997b] (**vaccine antigen design**)
- 17b: Study shows neutralization is not predicted by MAb binding to JRFL monomeric gp120, but is associated with oligomeric Env binding – 17b bound monomer, oligomer, and neutralized JRFL in the presence of sCD4, but if sCD4 was not present, 17b only bound monomer. Fouts *et al.* [1997]
- 17b: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env – 17b has synergistic response in combination with anti-V3 MAb 694/98-D. Li *et al.* [1997]
- 17b: Neutralizes TCLA strains, but not primary isolates. Parren *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- 17b: 48d binds to the IIIB protein and not IIIB V3 peptide, while binding to the Can0A V3 peptide, suggesting Can0A V3 is a conformer that mimics the 48d – it does not bind to 17b, distinguishing the epitopes. Weinberg *et al.* [1997]
- 17b: Binds to sgp120 efficiently, but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding – partial re-exposure if sCD4 was bound – could not bind to HXBc2 gp120 if the 19 C-term amino acids were deleted in conjunction with amino acids 31-93 in C1, but binding was restored in the presence of sCD4. Wyatt *et al.* [1997] (**antibody binding site definition and exposure**)
- 17b: Many MAbs inhibit binding (anti-C1, -C5, -C4, -CD4BS) – anti-V3 MAb 5G11 enhances binding, as do C1-

B Cell

C4 discontinuous epitopes A32 and 2/11c – enhances binding of some anti-V2 MAbs. Moore & Sodroski [1996] (**antibody interactions**)

- 17b: Binding did not result in significant gp120 dissociation from virion, in contrast to 48d, although the gp41 epitope of MAb 50-69 was exposed. Poignard *et al.* [1996a] (**antibody interactions**)
- 17b: Neutralizes JR-FL – inhibits gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a]
- 17b: MIP-1α binding to CCR-5 expressing cells can be inhibited by gp120-sCD4 — binding of 17b blocks this inhibition. Wu *et al.* [1996]
- 17b: Binds with higher affinity to monomer and oligomer, slow association rate, poor neutralization of lab strain – this is in contrast to 48d, which has very different kinetics. Sattentau & Moore [1995] (**kinetics**, **binding affinity**)
- 17b: Studies using a V1/V2 deletion mutant demonstrated that enhanced binding of 17b in the presence sCD4 involves the V1/V2 loops, with more significant involvement of V2 – similar effect observed for 48d and A32. Wyatt *et al.* [1995] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- 17b: A mutation in gp41, 582 A/T, confers resistance to neutralization (also confers resistance to MAbs F105, 48d, 21h and 15e). Thali *et al.* [1994] (**variant cross-recognition or cross-neutralization**)
- 17b: Binding of 48d is much more influenced by sequence variation among molecular clones of LAI than is binding of 17b. Moore *et al.* [1993c] (**variant cross-recognition or cross-neutralization**)
- 17b: Epitope is better exposed upon CD4 binding to gp120 – competes with 15e and 21h, anti-CD4 binding site MAbs – 113 D/R, 252 R/W, 257 T/A or G, 370 E/D, 382 F/L, 420 I/R, 433A/L, 438 P/R and 475 M/S confer decreased sensitivity to neutralization. Thali *et al.* [1993] (**antibody binding site definition and exposure**, **antibody interactions**)

- 21c: Called 2.1C. Of 35 Env-specific MAbs tested, only 2F5, 4E10, IgG1b12, and two CD4BS adjacent MAbs (A32 and 1.4G) and gp41 MAbs (2.2B and KU32) had binding patterns suggesting polyspecific autoreactivity, and similar reactivities may be difficult to induce with vaccines because of elimination of such autoreactivity. 2.1C has no indication of polyspecific autoreactivity. Haynes *et al.* [2005a] (**antibody binding site definition and exposure**)
- 21c: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **vaccine antigen design**, **review**)
- 21c: This review summarizes MAbs directed to HIV-1 Env. There are six CD4 inducible MAbs and Fabs in the database. The MAb forms neutralize TCLA strains only, but the smaller Fabs and scFv fragments can neutralize primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 21c: Five CD4i MAbs were studied, 17b, 48d and three new MAbs derived by Epstein-Barr virus transformation of PBMC from an HIV+ long term non-progressor – 23e and 21c were converted to hybridomas to increase Ab production – all compete with the well-characterized 17b CD4i MAb in an ELISA antigen capture assay – critical binding residues are mapped and the CD4i MAb epitopes were distinct but share a common element near isoleucine 420, also important for CCR5 binding, and all five can block CCR5 binding to a sCD4-gp120 complex – the MAb 48d has the epitope most similar to the CCR5 binding site. Xiang *et al.* [2002a] (**antibody binding site definition and exposure**, **antibody generation**)
- 21c: A series of mutational changes were introduced into the YU2 gp120 that favored different conformations – 375 S/W seems to favor a conformation of gp120 closer to the CD4-bound state, and is readily bound by sCD4 and CD4i MAbs (17b, 48d, 49e, 21c and 23e) but binding of anti-CD4BS MAbs (F105, 15e, IgG1b12, 21h and F91 was markedly reduced – IgG1b12 failed to neutralize this mutant, while neutralization by 2G12 was enhanced – 2F5 did not neutralize either WT or mutant, probably due to polymorphism in the YU2 epitope – another mutant, 423 I/P, disrupted the gp120 bridging sheet, favored a different conformation and did not bind CD4, CCR5, or CD4i antibodies, but did bind to CD4BS MAbs. Xiang *et al.* [2002b] (**antibody binding site definition and exposure**, **vaccine antigen design**)

Keywords antibody binding site definition and exposure, antibody generation, binding affinity, neutralization, review, subtype comparisons, vaccine antigen design

- 2.3E: Trimeric envelope glycoproteins with a partial deletion of the V2 loop derived from subtype B SF162 and subtype C TV1 were compared. The magnitude of 2.3E binding to subtype C trimer was lower than to subtype B trimer, either in the presence or absence of CD4. However, the fold increase in binding of 2.3E in presence of CD4 was similar for both subtypes, indicating similar structural rearrangements. Subtype C trimer had many biophysical, biochemical, and immunological characteristics similar to subtype B trimer, except for a difference in the three binding sites for CD4, which showed cooperativity of CD4 binding in subtype C but not in subtype B. Srivastava *et al.* [2008] (**binding affinity**, **subtype comparisons**)
- 23e: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. - 48d database comment: 48d and 17b have similar epitopes, and the pair are unique among human and rodent MAbs.
- 48d: NIH AIDS Research and Reference Reagent Program: 1756.

B Cell

- 48D: A new purification method was developed using a high affinity peptide mimicking CD4 as a ligand in affinity chromatography. This allowed the separation in one step of HIV envelope monomer from cell supernatant and capture of pre-purified trimer. Binding of 48D to gp120SF162 purified by the miniCD4 affinity chromatography and a multi-step method was comparable, suggesting that the miniCD4 allows the separation of HIV-1 envelope with intact 48D epitope. gp140DF162ΔV2 was purified by the miniCD4 method to asses its ability to capture gp140 trimers. Purified gp140DF162ΔV2 was recognized by 48D, and the k-off value for 48D was reduced compared to gp120SF162 monomer, consistent with the gp140DF162ΔV2 trimeric conformation. Binding of 48D to gp140DF162ΔV2 purified by the miniCD4 affinity chromatography and a multi-step method was comparable, suggesting that the SF162 trimer antigenicity was preserved. Martin *et al.* [2008] (**assay development**, **kinetics**, **binding affinity**)
- 4.8d: Transmission of HIV-1 by immature and mature DCs to CD4+ T lymphocytes was significantly higher for CXCR4- than for CCR5-tropic strains. However, preneutralization of X4 virus with 4.8d prior to capture efficiently blocked transmission to 75%, while transmission of R5 was blocked to 46%. van Montfort *et al.* [2008] (**co-receptor**, **neutralization**, **dendritic cells**)
- 48d: Contemporaneous biological clones of HIV-1 were isolated from plasma of chronically infected patients and tested for their functional properties. The clones showed striking functional diversity both within and among patients, including differences in infectivity and sensitivity to inhibition by 48d. There was no correlation between clonal virus infectivity and sensitivity to 48d inhibition, indicating that these properties are dissociable. The sensitivity to 48d inhibition was, however, a property shared by viruses from a given patient, suggesting that the genetic determinants that define this sensitivity may lie in regions that are not necessarily subject to extensive diversity. Nora *et al.* [2008] (**neutralization**)
- 4.8d: Trimeric envelope glycoproteins with a partial deletion of the V2 loop derived from subtype B SF162 and subtype C TV1 were compared. The magnitude of 4.8d binding to subtype C trimer was lower than to subtype B trimer, either in the presence or absence of CD4. However, the fold increase in binding of 4.8d in presence of CD4 was similar for both subtypes, indicating similar structural rearrangements. Subtype C trimer had many biophysical, biochemical, and immunological characteristics similar to subtype B trimer, except for a difference in the three binding sites for CD4, which showed cooperativity of CD4 binding in subtype C but not in subtype B. Srivastava *et al.* [2008] (**binding affinity**, **subtype comparisons**)
- 48d: 48d structure, binding and neutralization activity, are reviewed in detail. Lin & Nara [2007] (**review**)
- 4.8d: 4.8d-neutralized HIV-1 captured on Raji-DC-SIGN cells or immature monocyte-derived DCs (iMDDCs) was successfully transferred to CD4+ T lymphocytes, indicating that the 4.8d-HIV-1 complex was disassembled upon capture by DC-SIGN-cells. van Montfort *et al.* [2007] (**neutralization**, **dendritic cells**)
- 48d: This Ab was shown to infrequently neutralize cloned Envs (clades A, B, C, D, F1, CRF01_AE, CRF02_AG, CRF06_cpx and CRF11_cpx) derived from donors with and without broadly cross-reactive neutralizing antibodies. Cham *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 4.8d: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- 48d: The structure of the V3 region in the context of gp120 core complexed to the CD4 receptor and to the 48d Ab was attempted to be determined by X-ray resolution, but only the structure for V3 complexed with CD4 and X5 Ab was solved. Huang *et al.* [2005a] (**structure**)
- 48d: Point mutations in the highly conserved structural motif LLP-2 within the intracytoplasmic tail of gp41 resulted in conformational alternations of both gp41 and gp120. The alternations did not affect virus CD4 binding, coreceptor binding site exposure, or infectivity of the virus, but did result in decreased binding and neutralization by certain MAbs and human sera. 48d exhibited similar levels of binding to both the LLP-2 mutant and wildtype viruses, indicating that sCD4 binding to the LLP-2 mutant successfully triggered conformational change of gp120 and exposure of the co-receptor binding site. Kalia *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)
- 48d: The epitope for the MAb D19 is conserved and embedded in V3. D19 is unique in that for R5 viruses, it was cryptic and did not bind without exposure to sCD4, and for X4 and R5X4 isolates it was constitutively exposed. D19b is unqiue among CD4i antibodies in that it binds to the V3 loop. CD4i MAbs 17b and 48d were used as controls for CD4i characterization; in contrast to D19, other CD4i MAbs bind to the conserved bridging sheet and do not differentiate between R5 and X4 using strains. Lusso *et al.* [2005]
- 48d: The HIV-1 Bori-15 variant was adapted from the Bori isolate for replication microglial cells. Bori-15 had increased replication in microglial cells and a robust syncytium-forming phenotype, ability to use low levels of CD4 for infection, and increased sensitivity to neutralization by sCD4 and 17b. Four amino acid changes in gp120 V1-V2 were responsible for this change. Protein functionality and integrity of soluble, monomeric gp120-molecules derived from parental HIV-1 Bori and microglia-adapted HIV-1 Bori-15 was assessed in ELISA binding assays using F105, IgG1b12, 17b and 48d, 2G12 and 447-52D. Association rates of sCD4 and 17b were not changed, but dissociation rates were 3-fold slower for sCD4 and 14-fold slower for 17b. Equilibrium binding studies showed 48d bound better to Bori-15 than Bori in the absence of sCD4, while 17b bound identically. Martín-García *et al.* [2005] (**antibody binding site definition and exposure**)
- 48D: Escape mutations in HR1 of gp41 that confer resistance to Enfuvirtide reduced infection and fusion efficiency and also delayed fusion kinetics of HIV-1. The mutations also conferred increased neutralization sensitivity of virus to 48D. Enhanced neutralization correlated with reduced fusion kinetics, indicating that the mutations result in Env proteins remaining in the CD4-triggered state for a longer period of time. Reeves

B Cell

et al. [2005] (**antibody binding site definition and exposure**, **drug resistance**, **neutralization**, **escape**, **HAART, ART**)

- 48d: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened while not obscuring b12 binding. CD4i MAbs (48d, 17b) did not bind to either GDMR or mCHO even with sCD4. Selvarajah *et al.* [2005] (**vaccine antigen design**, **vaccine-specific epitope characteristics**)
- 48D: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**, **review**, **structure**)
- 48d: This Ab bound weakly to gp120IIIb and had no inhibitory effect on gp120 antigen presentation by MHC class II. 48d disassociated from gp120 at acidic pH. Lysosomal enzyme digestion of gp120 treated with 48d yielded fragmentation rate and pattern similar to that of gp120 alone. It is thus concluded that CD4i Ab 48d does not have an inhibitory effect on gp120 processing and presentation. Tuen *et al.* [2005] (**antibody interactions**, **binding affinity**)
- 48d: Ab neutralization of viruses with mixtures of neutralization-sensitive and neutralization-resistant envelope glycoproteins was measured. It was concluded that binding of a single Ab molecule is sufficient to inactivate function of an HIV-1 glycoprotein trimer. The inhibitory effect of the Ab was similar for neutralization-resistant and -sensitive viruses indicating that the major determinant of neutralization potency of an Ab is the efficiency with which it binds to the trimer. It was also indicated that each functional trimer on the virus surface supports HIV-1 entry independently, meaning that every trimer on the viral surface must be bound by an Ab for neutralization of the virus to be achieved. Yang *et al.* [2005c] (**neutralization**)
- 48d: A substantial fraction of soluble envelope glycoprotein trimers contained inter-subunit disulfide bonds. Reduction of these disulfide bonds decreased binding of 48d to the glycoprotein, indicating that the inter-S-S bonds contribute to the exposure of the CD4-induced region. Yuan *et al.* [2005] (**antibody binding site definition and exposure**)
- 48d: This review summarizes MAbs directed to HIV-1 Env. There are six CD4 inducible MAbs and Fabs in the database. The MAb forms neutralize TCLA strains only, but the smaller Fabs and scFv fragments can neutralize primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 48d: Sera from two HIV+ people and a panel of MAbs were used to explore susceptibility to neutralization in the presence or absence of glycans within or adjacent to the V3 loop and within the C2, C4 and V5 regions of HIV-1 SF162 env gp120. The loss of the glycan within the V3 loop (GM299 V3) and two sites adjacent to V3, C2 (GM292 C2) and (GM329 C3), increased neutralization susceptibility to CD4i FAb X5, but each of the glycan mutants and SF162 were refractive to neutralization with 48d and 17b. The loss of sites in C4 (GM438 C4), or V5 (GM454 V5) did not increase neutralization susceptibility to FAb X5. V3 glycans tended to shield V3 loop, CD4 and co-receptor MAb binding sites, while C4 and V5 glycans shielded V3 loop, CD4, gp41 but not co-receptor MAb binding sites. Selective removal of glycans from a vaccine candidate may enable greater access to neutralization susceptible epitopes. McCaffrey *et al.* [2004] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- 48d: A set of HIV-1 chimeras that altered V3 net charge and glycosylation patterns in V1V2 and V3, involving inserting V1V2 loops from a late stage primary isolate taken after the R5 to X4 switch, were studied with regard to phenotype, co-receptor usage, and MAb neutralization. The loops were cloned into a HXB2 envelope with a LAI viral backbone. It was observed that the addition of the late-stage isolate V1V2 region and the loss of V3-linked glycosylation site in the context of high positive charge gave an X4 phenotype. R5X4, R5, and X4 viruses were generated, and sCD4, 2G12 and b12 neutralization resistance patterns were modified by addition of the late stage V1V2, glycosylation changes, and charge in concert, while neutralization by 2F5 was unaffected. 15e, 17b, and 48d could not neutralize any of the variants tested. Nabatov *et al.* [2004] (**antibody binding site definition and exposure**, **co-receptor**)
- 48d: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including 48d. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- 48d: V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neturalization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12, which neutralized both strains), neutralized the SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype. Three CD4i MAbs were tested; all preferentially neutralized SF162, and JRFL became neutralization sensitive to CD4i Abs if the SF162 V1V2 loop was exchanged. Pinter *et al.* [2004] (**variant cross-recognition or cross-neutralization**)
- 48d: Called 4.8d. The MAb B4e8 binds to the base of the V3 loop, neutralizes multiple primary isolates and was studied for interaction with other MAbs. B4e8 enhanced binding of CD4i MAbs 4.8d, 1.7b, and A1g8 to R5X4 virus 92HT593, but only of 48d to the R5 virus 92US660, and there was only a modest impact of the combination of B4e8 and CD4i MAbs on

B Cell

neutralization. Cavacini *et al.* [2003] (**antibody interactions**, **co-receptor**)

- 48d: 48d was used as a negative control to test CDR3 tyrosine sulfation of MAbs 47e, 412d, CM51 and E51, since it lacks CDR3 tyrosines. As expected, 48d did not incorporate sulfates while the other MAbs did. Neutralization assays showed that 48d was less efficient at neutralizing primary R5 and R5X4 isolates than MAbs 412d and E51, however, it was more efficient at neutralizing X4 isolates than these MAbs. Choe *et al.* [2003] (**antibody binding site definition and exposure**, **neutralization**)
- 48d: This study shows the fragments of CD4i MAbs are better able to neutralize virus than whole IgG. Neutralization of HIV-1 R5 isolates JRFL, JR-CSF and ADA by CD4i MAbs X5, 17b, and 48d decreased with increased molecule size, the neutralizing potency of single-chain Fv (scFv) > than Fab fragments > whole Ab molecules. (With the exception of IgG 48d neutralization of HIV-1 ADA being better than the Fab – for 48d, only the IgG and Fab forms were available, not the scFv.) HIV-1 X4 isolates 89.6 and HxB2 are both relatively sensitive even to the larger IgG version. R5X4 isolate neutralization was dependent on the isolate and co-receptor usage. The CD4i MAb fragments neutralize HIV-1 subsequent to CD4 binding. The CD4i MAbs bind near the co-receptor binding sites on gp120. Co-receptors bind to the conserved beta19 strand and part of the V3 loop, regions that are masked by the V1V2 loops in the CD4-unbound state. When CD4 is bound, the co-receptor site is exposed near the membrane surface where it would be optimally accessible to co-receptors, and the smaller versions of the molecules are better able to overcome the steric hindrence. Labrijn *et al.* [2003] (**antibody binding site definition and exposure**, **co-receptor**, **variant cross-recognition or cross-neutralization**)
- 48d: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- 48d: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a CD4i MAb that had no impact on 4KG5 binding. Zwick *et al.* [2003] (**antibody interactions**)
- 48d: This study examined antibody interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4 isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate. Anti-V3 MAb B4a1 increased binding of CD4i MAbs 48d, 17b and A1g8, but only A1g8 binding was increased by B4a1 to the R5 isolate. Additive affects on neutralizaton of the R5X4 isolate with B4a1 and CD4i MAbs was observed, presumably due to increased exposure of the CD4i binding site, but not for the R5 isolate. Anti-gp41 MAb F240 had a synergistic effect on neutralization with CD4i MAbs 48d and 17b, but not with A1g8 for the R5X4 virus. Cavacini *et al.* [2002] (**variant cross-recognition or cross-neutralization**)
- 48d: Truncation of the gp41 cytoplasmic domain of X4, R5, and X4R5 viruses forces a conformation that more closely resembles the CD4 bound state of the external Envelope, enhancing binding of CD4i MAbs 17b and 48d and of CD4BS MAbs F105, b12, and in most cases of glycosylation site dependent MAb 2G12 and the anti-gp41 MAb 246D – in contrast, binding of the anti-V2 MAb 697D and the anti-V3 MAb 694/98D were not affected – viruses bearing the truncation were more sensitive to neutralization by MAbs 48d, b12, and 2G12 – the anti-C5 MAb 1331A was used to track levels of cell surface expression of the mutated proteins. Edwards *et al.* [2002] (**co-receptor**)
- 48d: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – the preincubation 31.5 C step did not alter the inhibitory activity of neutralizing Abs anti-gp41 2F5, or anti-gp120 2G12, IG1b12, 48d, and 17b. Golding *et al.* [2002b]
- 48d: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar. Enthalpy and entropy changes were divergent, but compensated. Not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs (17b, 48d, 1.5e, b6, F105 and F91) had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, but the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. The high values suggest surface burial or protein folding an ordering of amino acids. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)
- 48d: A series of mutational changes were introduced into the YU2 gp120 that favored different conformations – 375 S/W seems to favor a conformation of gp120 closer to the CD4-bound state, and is readily bound by sCD4 and CD4i MAbs (17b, 48d, 49e, 21c and 23e) but binding of anti-CD4BS MAbs (F105, 15e, IgG1b12, 21h and F91 was markedly reduced – IgG1b12 failed to neutralize this mutant, while neutralization by 2G12 was enhanced – 2F5 did not neutralize either WT or mutant, probably due to polymorphism in the YU2 epitope – another mutant, 423 I/P, disrupted the gp120 bridging sheet, favored a different conformation and did not bind CD4, CCR5, or CD4i antibodies, but did bind to CD4BS

B Cell

MAbs. Xiang *et al.* [2002b]

- 48d: Five CD4i MAbs were studied, 17b, 48d and three new MAbs derived by Epstein-Barr virus transformation of PBMC from an HIV+ long term non-progressor – 23e and 21c were converted to hybridomas to increase Ab production – all compete with the well-characterized 17b CD4i MAb in an ELISA antigen capture assay – critical binding residues are mapped and the CD4i MAb epitopes were distinct but share a common element near isoleucine 420, also important for CCR5 binding, and all five can block CCR5 binding to a sCD4-gp120 complex – the MAb 48d has the epitope most similar to the CCR5 binding site. Xiang *et al.* [2002a] (**antibody binding site definition and exposure**, **co-receptor**)
- 48d: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin – stabilized oligomer gp140 delta683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and C11, A32, and 30D which did not bind the stabilized oligomer. Yang *et al.* [2002]
- 48d: Called 4.8D – A rare mutation in the neutralization sensitive R2-strain in the proximal limb of the V3 region caused Env to become sensitive to neutralization by MAbs directed against the CD4 binding site (CD4BS), CD4-induced (CD4i) epitopes, soluble CD4 (sCD4), and HNS2, a broadly neutralizing sera – 2/12 anti-V3 MAbs tested (19b and 694/98-D) neutralized R2, as did 2/3 anti-CD4BS MAbs (15e and IgG1b12), 2/2 CD4i MAbs (17b and 4.8D), and 2G12 and 2F5 – thus multiple epitopes on R2 are functional targets for neutralization and the neutralization sensitivity profile of R2 is intermediate between the highly sensitive MN-TCLA strain and the typically resistant MN-primary strain. Zhang *et al.* [2002] (**variant cross-recognition or cross-neutralization**)
- 48d: Using a cell-fusion system, it was found CD4i antibodies 17b, 48d, and CG10 reacted faintly with Env expressing HeLA cells even in the absence of sCD4 or CD4 expressing target cells. Reactivity increased after sCD4 addition, but not after CD4 expressing target cell addition, and binding was not increased at the cell-to-cell CD4-Env interface. This suggests the CD4i co-receptor binding domain is largely blocked at the cell-fusion interface, and so CD4i antibodies would not be able access this site and neutralize cell-mediated viral entry. Finnegan *et al.* [2001] (**antibody binding site definition and exposure**)
- 48d: Mutations in two glcosylation sites in the V2 region of HIV-1 ADA at positions 190 and 197 (187 DNTSYRLINC-NTS 199) cause the virus to become CD4-independent and able to enter cells through CCR5 alone – these same mutations tended to increase the neutralization sensitivity of the virus, including to 48d – only the CD4i antibodies 17b and 48d showed an increased affinity of the CD4 independent viruses relative to wild-type. Kolchinsky *et al.* [2001]
- 48d: Called 4.8d – A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. Verrier *et al.* [2001]
- 48d: Called 4.8D – host encoded intercellular adhesion molecule (ICAM-1) is incorporated by the HIV-1 virion and enhances viral infectivity – ICAM-1 does not modify virus sensitivity to antibodies 0.5beta or 4.8D or sCD4, but neutralizing ability of F105 was diminished in ICAM bearing virions in the presence of lymphocyte function-association antigen-1 (LFA-1) Ab. Fortin *et al.* [2000]
- 48d: SF162 is a neutralization-resistant HIV-1 isolate – N-linked glycosylation modifications in the V2 loop of the SF162 gp120 revealed that these sites prevent neutralization by CD4BS MAbs (IgG1b12 and IgGCD4), and protect against neutralization by V3 MAbs (447-D and 391-95D) – V2-region glycosylation site mutations did not alter neutralization resistance to V2 MAbs (G3.4 and G3.136) or CD4i MAbs (17b and 48d) – V2 glycosylation site modification allows infection of macrophages, probably due to glycosylated forms requiring fewer CCR5 molecules for viral entry. Ly & Stamatatos [2000]
- 48d: Six mutations in MN change the virus from a high-infectivity neutralization resistant phenotype to low-infectivity neutralization sensitive – V3, CD4BS, and CD4i MAbs are 20-100 fold more efficient at neutralizing the sensitive form – the mutation L544P reduced binding of all MAbs against gp120 by causing conformational changes. Park *et al.* [2000]
- 48d: sCD4 can activate fusion between effector cells expressing Env and target cells expressing coreceptor (CCR5 or CXCR4) alone without CD4 – CD4i MAbs 17b and 48d have little effect on a standard cell fusion assay but potently block sCD4 activated fusion. Salzwedel *et al.* [2000] (**co-receptor**)
- 48d: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) that preserve and expose some neutralizing epitopes while occluding some non-neutralizing epitopes – CD4BS MAbs (F105 and F91) and CD4i (17b and 48d) recognized gp140-GNC4 as well as gp120 or gp140 – non-neutralizing MAbs C11, A32, 522-149, M90, and #45 bound to the gp140-GNC4 glycoprotein at reduced levels compared to gp120 – MAbs directed at the extreme termini of gp120 C1 (135/9 and 133/290) and C5 (CRA-1 and M91) bound efficiently to gp140-GNC4. Yang *et al.* [2000]
- 48d: A CD4-independent viral variant of IIIB, IIIBx, was generated on CXCR4-expressing cells – IIIBx exhibited greater exposure of the 17b and 48d epitopes and enhanced neutralization by CD4i MAbs and by polyclonal human sera. Hoffman *et al.* [1999]
- 48d: A panel of MAbs were shown to bind with similar or greater affinity and similar competition profiles to a deglycosylated or variable loop deleted core gp120 protein (Delta V1, V2, and V3), thus such a core protein produces a structure closely approximating full length folded monomer – CD4i MAbs 17b and 48d bound better to the deleted protein than to wild type. Binley *et al.* [1998]

B Cell

- 48d: Infection of dendritic cells cultured from CD14+ blood cells or from cadaveric human skin was blocked by neutralizing MAbs IgG1b12, or 2F5 and 2G12 delivered together, but not by control non-neutralizing anti-gp120 MAb 4.8D, indicating that NAbs could interrupt early mucosal transmission events. Frankel *et al.* [1998]
- 48d: Inhibits binding of Hx10 to both CD4 positive and CD4 negative HeLa cells. Mondor *et al.* [1998]
- 48d: The MAb and Fab binding to the oligomeric form of gp120 and neutralization were highly correlated – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a]
- 48d: Deleting the V2 loop of neutralization-resistant HIV-1 isolate SF162 does not abrogate its replication in PBMC or macrophages, but it enhances its neutralization sensitivity to sera from patients with B clade infection up to 170-fold, and also enhances sensitivity to sera from clades A through F – deletion of V2 but not V1 enabled neutralization by CD4i MAbs 17b and 48d. Stamatatos & Cheng-Mayer [1998]
- 48d: CD4i MAbs 17b and 48d compete with MAb CG10, and the binding sites may overlap – MAb A32 enhances binding of 17b, 48d and CG10. Sullivan *et al.* [1998b]
- 48d: Summary of the implications of the crystal structure of the core of gp120 bound to CD4 and 17b with what is known about mutations that reduce NAb binding – probable mechanism of neutralization of 48d is interference with chemokine receptor binding – CD4 binding increases exposure of epitope due to V2 loop movement – 88N, 117K, 121K, 256S, 257T, N262, delta V3, E370, E381, F 382, R 419, I 420, K 421, Q 422, I 423, W 427, Y 435, P 438, M 475 mutations in HXBc2 (IIIB) decrease binding. Wyatt *et al.* [1998] (**structure**)
- 48d: A neutralization assay was developed based on hemi-nested PCR amplification of the LTR (HNPCR) – LTR-HNPCR consistently revealed HIV DNA and was shown to be a rapid, specific and reliable neutralization assay based on tests with 6 MAbs and 5 isolates. Yang *et al.* [1998]
- 48d: Prefers CD4-gp120 complex to gp120 alone, but does not enhance fusion, in contrast to MAb CG10, in fact it inhibits syncytium formation. Lee *et al.* [1997] (**antibody binding site definition and exposure**)
- 48d: One of 14 human MAbs tested for ability to neutralize a chimeric SHIV-vpu+, which expressed HIV-1 IIIB env – all Ab combinations tested showed synergistic neutralization – 48d has synergistic response with MAbs 694/98-D (anti-V3) and F105. Li *et al.* [1997] (**antibody interactions**)
- 48d: Neutralizes TCLA strains, but not primary isolates. Parren *et al.* [1997b] (**variant cross-recognition or cross-neutralization**)
- 48d: Viral binding inhibition by 48d was strongly correlated with neutralization (all other neutralizing MAbs tested showed some correlation except 2F5). Ugolini *et al.* [1997]
- 48d: 48d binds to the IIIB protein and not IIIB V3 peptide, while binding to the Can0A V3 peptide, suggesting Can0A V3 is a conformer that mimics the 48d, (but not 17b), epitope. Weinberg *et al.* [1997] (**antibody binding site definition and exposure**)
- 48d: Binds efficiently to sgp120 but not soluble gp120+gp41, suggesting its gp120 epitope is blocked by gp41 binding. Wyatt *et al.* [1997] (**antibody binding site definition and exposure**)
- 48d: Many MAbs inhibit binding (anti-C1, -C5, -C4, -CD4BS) – anti-C1-C4 discontinuous epitope MAbs A32 and 2/11c enhance binding – reciprocal enhanced binding with some anti-V2 MAbs. Moore & Sodroski [1996] (**antibody interactions**)
- 48d: Binding resulted in gp120 dissociation from virion, mimicking sCD4, and exposure of the gp41 epitope of MAb 50-69, in contrast to CD4BS MAbs. Poignard *et al.* [1996a] (**antibody interactions**)
- 48d: Neutralizes JR-FL – slightly inhibits gp120 interaction with CCR-5 in a MIP-1beta-CCR-5 competition study. Trkola *et al.* [1996a] (**antibody binding site definition and exposure**, **co-receptor**)
- 48d: Called 4.8D – Found to neutralize MN, but not JRCSF, two B subtype primary isolates, or a D subtype primary isolate, by most labs in a multi-laboratory study involving 11 labs. D'Souza *et al.* [1995] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 48d: Formalin inactivation of virus at 0.1% formalin for 10 hours at 4 degrees was optimal for inactivation of virus while maintaining epitope integrity. Sattentau *et al.* [1995] (**vaccine antigen design**)
- 48d: Binds with similar affinity to monomer and oligomer, moderate association rate, potent neutralization – this is in contrast to 17b, which has very different kinetics. Sattentau & Moore [1995] (**antibody binding site definition and exposure**, **kinetics**, **binding affinity**)
- 48d: Studies using a V1/V2 deletion mutant demonstrated that enhanced binding of 48d in the presence of sCD4 involves the V1/V2 loops, with more significant involvement of V2 – similar effect observed for 17b and A32. Wyatt *et al.* [1995] (**vaccine antigen design**)
- 48d: Poor cross-reactivity with gp120 from most clades. Moore *et al.* [1994b] (**subtype comparisons**)
- 48d: A mutation in gp41, 582 A/T, confers resistance to neutralization (also confers resistance to MAbs F105, 21h, 15e and 17b). Thali *et al.* [1994] (**variant cross-recognition or cross-neutralization**)
- 48d: Called 4.8d – Neutralizes IIIB – reactive with SF-2 gp120 – does not inhibit HIV-1 sera from binding to IIIB gp120. Moore & Ho [1993] (**variant cross-recognition or cross-neutralization**)
- 48d: Binding of 48d is much more influenced by sequence variation among molecular clones of LAI than is binding of 17b. Moore *et al.* [1993c] (**variant cross-recognition or cross-neutralization**)
- 48d: Epitope is better exposed upon CD4 binding to gp120 – competes with ICR 39.13, 15e and 21h, anti-CD4 binding site MAbs – inhibited by anti-CD4BS MAb ICR 39.13g and linear anti-C4 MAbs G3-42 and G3-508 – 113 D/R, 252 R/W, 257 T/A or G, 370 E/D, 382 F/L, 420 I/R, 421 K/L, 433A/L, 438 P/R and 475 M/S confer decreased sensitivity to neutralization. Thali *et al.* [1993] (**antibody binding site definition and exposure**, **antibody interactions**)

- 49e: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **vaccine antigen design**, **review**)
- 49e: This review summarizes MAbs directed to HIV-1 Env. There are six CD4 inducible MAbs and Fabs in the database. The MAb forms neutralize TCLA strains only, but the smaller Fabs and scFv fragments can neutralize primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- 49e: Five CD4i MAbs were studied, 17b, 48d and three new MAbs derived by Epstein-Barr virus transformation of PBMC from an HIV+ long term non-progressor – 23e and 21c were converted to hybridomas to increase Ab production – all compete with the well-characterized 17b CD4i MAb in an ELISA antigen capture assay – critical binding residues are mapped and the CD4i MAb epitopes were distinct but share a common element near isoleucine 420, also important for CCR5 binding, and all five can block CCR5 binding to a sCD4-gp120 complex – the MAb 48d has the epitope most similar to the CCR5 binding site. Xiang *et al.* [2002a] (**antibody binding site definition and exposure**, **antibody generation**)
- 49e: A series of mutational changes were introduced into the YU2 gp120 that favored different conformations – 375 S/W seems to favor a conformation of gp120 closer to the CD4-bound state, and is readily bound by sCD4 and CD4i MAbs (17b, 48d, 49e, 21c and 23e) but binding of anti-CD4BS MAbs (F105, 15e, IgG1b12, 21h and F91 was markedly reduced – IgG1b12 failed to neutralize this mutant, while neutralization by 2G12 was enhanced – 2F5 did not neutralize either WT or mutant, probably due to polymorphism in the YU2 epitope – another mutant, 423 I/P, disrupted the gp120 bridging sheet, favored a different conformation and did not bind CD4, CCR5, or CD4i antibodies, but did bind to CD4BS MAbs. Xiang *et al.* [2002b] (**antibody binding site definition and exposure**, **vaccine antigen design**)

- Fbb21: scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This is a novel CD4i Fab first used in this study. Fbb21, like other CD4i MAbs, did not inhibit or enhance 4KG5 binding. Zwick *et al.* [2003] (**antibody interactions**)

- X5: The study compared Ab neutralization against the JR-FL primary isolate and trimer binding affinities judged by native PAGE. There was direct quantitative relationship between monovalent Fab-trimer binding and neutralization, implying that neutralization begins as each trimer is occupied by one Ab. In BN-PAGE, neutralizing Fabs and sCD4 were able to shift JR-FL trimers. In contrast, most non-neutralizing Fabs, bound to monomer, but their epitopes were conformationally occluded on trimers, confirming the exclusive relationship of trimer binding and neutralization. Fab X5 did not bind effectively to gp120/gp41 monomers and may therefore recognize other forms of Env. Crooks *et al.* [2008] (**neutralization**, **binding affinity**)
- X5: Coordinates of the three-dimensional structure of trimeric Env displayed on native HIV-1 in complex with X5 were fitted on a density map, to reveal the structure of the trimeric glycoprotein spike on native HIV-1. Liu *et al.* [2008] (**antibody binding site definition and exposure**, **structure**)
- X5: A new purification method was developed using a high affinity peptide mimicking CD4 as a ligand in affinity chromatography. This allowed the separation in one step of HIV envelope monomer from cell supernatant and capture of pre-purified trimer. Binding of X5 to gp120SF162 purified by the miniCD4 affinity chromatography and a multi-step method was comparable, suggesting that the miniCD4 allows the separation of HIV-1 envelope with intact X5 epitope. gp140DF162ΔV2 was purified by the miniCD4 method to asses its ability to capture gp140 trimers. Purified gp140DF162ΔV2 was recognized by X5, and the k-off value for X5 was reduced compared to gp120SF162 monomer, consistent with the gp140DF162ΔV2 trimeric conformation. Binding of X5 to gp140DF162ΔV2 purified by the miniCD4 affinity chromatography and a multi-step method was comparable, suggesting that the SF162 trimer antigenicity was preserved. Martin *et al.* [2008] (**assay development**, **kinetics**, **binding affinity**)
- X5: Immobilized X5 was able to capture infectious HIV-1 whole virions in a standard virus capture assay, unlike mAbs 8K8 and D5. Addition of soluble CD4 enhanced significantly virion capture by X5. Nelson *et al.* [2008]
- X5: The structure of a soluble CD4-FabX5-complexed gp120 core with the V3 loop attached was used to project the results of MAb mapping onto V3 in order to obtain better understanding of the spatial organization of residues identified as important for V3 MAb binding. Pantophlet *et al.* [2008] (**structure**)
- X5: This minireview summarizes data on differences in neutralizing activities of MAbs and pooled human sera using a traditional primary cell neutralization assay and the more standardized TZM-bl reporter cell line assay. Also, suggestions are made on how to improve and standardize neutralization assays for comparable use in different laboratories. It has previously been shown that X5 neutralizes considerably better in the PBMC assay, where the CD4/CCR5 ratio is approximately 10-fold larger than in the TZM-assay cells, underscoring the role of the cell substrate in neutralization assays. In total, however, the assay discordances were shown to be bi-directional and not attributable to assay sensitivity. Polonis *et al.* [2008] (**neutralization**, **review**, **assay standardization/improvement**)
- X5: Sera from both gp120 DNA prime-protein boost immunized rabbits and from protein-only immunized rabbits did not compete for binding to X5, indicating no elicitation of X5-like Abs by either of the immunization regimens. Vaine *et al.* [2008] (**vaccine antigen design**)
- X5: The various effects that neutralizing and non-neutralizing anti-envelope Abs have on HIV infection are reviewed, such as Ab-mediated complement activation and Fc-receptor mediated activities, that both can, through various mechanisms, increase and decrease the infectivity of the virus. The importance of these mechanisms in vaccine design is discussed. The unusual features of the X5 MAb are described. Willey & Aasa-Chapman [2008] (**review**)
- X5: A direct comparison of phage and yeast display libraries was undertaken, and yeast display sampled the immune repertoire more fully. Previous results from panning a phage library generated from a long-term non-progressor were compared directly with a yeast library. As determined by sequencing, many MAbs were common to both, although the yeast library identifies unique scFv. X5 was identified using both methods. Bowley *et al.* [2007] (**antibody generation**, **binding affinity**, **antibody sequence variable domain**, **assay standardization/improvement**)
- X5: Guinea pigs were immunized with gp120 protein or with three types of VLPs containing disulfide-shackled functional trimers (SOS-VLP), uncleaved nonfunctional Env (UNC-VLP), naked VLP bearing no Env. Most of the Env-VLP sera and HIV-1 + plasma effectively blocked X5 capture. Crooks *et al.* [2007] (**neutralization**)

- X5: Macaques were immunized with either CD4, gp120, cross-linked gp120-human CD4 complex (gp120-CD4 XL), and with single chain complex containing gp120 rhesus macaque CD4 domains 1 and 2 (rhFLSC). Sera from the rhFLSC immunized animals showed highest competition titers, being able to block gp120-CD4 complex interactions with X5 more efficiently than sera from animals immunized with the three other proteins. DeVico *et al.* [2007] (**neutralization**)
- X5: HIV-1 env sequence evolution was studied in 20 HIV-1 infected individuals undergoing treatment interruptions. By using the 3D structure of gp120 in complex with CD4 and X5, the amino acid residues that were found to be under positive selection mapped exclusively to the externally accessible residues of the gp120. There was no correlation between the number of positively selected amino acid sites and neutralizing Ab titers. Joos *et al.* [2007]
- X5: This review summarizes X5 Ab epitope, properties and neutralization activity. The effect of differential CCR5 cell surface expression on X5 neutralization activity is discussed. Kramer *et al.* [2007] (**co-receptor**, **neutralization**, **review**)
- X5: X5 structure, sulfation, binding, and neutralization activity are reviewed in detail. Improvement of potency and breadth of X5 neutralization is discussed. Vaccine strategies for elicitation of CD4i Abs are summarized. Lin & Nara [2007] (**review**)
- X5: This review summarizes data on possible vaccine targets for elicitation of neutralizing Abs and discusses whether it is more practical to design a clade-specific than a clade-generic HIV-1 vaccine. Development of a neutralizing Ab response in HIV-1 infected individuals is reviewed, including data that show no apparent division of different HIV-1 subtypes into clade-related neutralization groups. Also, a summary of the neutralizing activity of mAb X5 in different HIV-1 clades is provided. McKnight & Aasa-Chapman [2007] (**variant cross-recognition or cross-neutralization**, **review**)
- X5: This review provides information on the HIV-1 glycoprotein properties that make it challenging to target with neutralizing Abs. X5 neutralization properties and binding to HIV-1 envelope, and current strategies to develop versions of the Env spike with functional trimer properties for elicitation of broadly neutralizing Abs, are discussed. In addition, approaches to target cellular molecules, such as CD4, CCR5, CXCR4, and MHC molecules, with therapeutic Abs are reviewed. Phogat *et al.* [2007] (**review**)
- X5: Novel approaches based on sequential (SAP) and competitive (CAP) antigen panning methodiologies, and use of antigens with increased exposure of conserved epitopes, for enhanced identification of broadly cross-reactive neutralizing Abs are reviewed. Abs identified by these methods are described. Zhang & Dimitrov [2007] (**review**)
- X5: Virus was not neutralized by X5 in a standard neutralization assay, while pre-incubation of virus with sCD4 resulted in neutralization by X5 as its epitope was exposed upon binding to CD4. Binley *et al.* [2006] (**antibody binding site definition and exposure**, **neutralization**, **binding affinity**)
- X5: Cloned Envs (clades A, B, C, D, F1, CRF01_AE, CRF02_AG, CRF06_cpx and CRF11_cpx) derived from donors either with or without broadly cross-reactive neutralizing antibodies were shown to be of comparable susceptibility to neutralization by X5. Cham *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- X5: Neutralization of HIV-1 primary isolates from different clades (B, C, D and E) by X5 was determined in cells expressing high or low surface concentrations of CD4 and CCR5 receptors. CD4 cell surface concentration had no effect on the inhibitory activity of this Ab while the CCR5 surface concentration had a significant effect decreasing the 50% inhibitory concentration of X5 in cell lines with low CCR5. Choudhry *et al.* [2006] (**co-receptor**, **neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- X5: Macaques were immunized with SF162gp140, ΔV2gp140, ΔV2ΔV3gp140 and ΔV3gp140 constructs and their antibody responses were compared to the broadly reactive NAb responses in a macaque infected with SHIV SF162P4, and with pooled sera from humans infected with heterologous HIV-1 isolates (HIVIG). X5-like Abs were elicited at low titers by ΔV3gp140 but not by the other immunogens. They were also present in the SHIV-infected macaque. Derby *et al.* [2006] (**antibody binding site definition and exposure**, **antibody generation**)
- X5: In addition to gp120-gp41 trimers, HIV-1 particles were shown to bear nonfunctional gp120-gp41 monomers and gp120-depleted gp41 stumps on their surface. X5 did not neutralize wildype virus particles and it did not bind to functional gp12-gp41 trimers. It did, however, partially react with SOS, a mutant containing a disulfide bond between gp120 and gp41. X5 is able to recognize gp120-gp41 monomers and monomeric gp120. It is hypothesized that the nonfunctional monomers on the HIV-1 surface serve to divert the Ab response, helping the virus to avoid neutralization. Moore *et al.* [2006] (**antibody binding site definition and exposure**, **neutralization**)
- X5: The structure of the X5 MAb, particularly its CDRH3 region tyrosine sulfation, is reviewed. Also, the mechanism of its binding to the coreceptor binding site of gp120, and comparisons of the neutralizing potencies of X5 Ab fragments vs the whole IgG molecule are discussed. Engineering of Abs based on revealed structures of broadly neutralizing MAbs is discussed. Burton *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **review**, **structure**)
- X5: X5 was investigated in differnt neutralization formats, including the standard format that measures activity over the entire infection period and several formats that emphasize various stages of infection. Significant activity of X5 was induced in the post-CD4 format while it did not neutralize JR-FL in the standard format. X5 did not have any activity in the post-CD4/CCR5 format. This suggests that the post-CD4, pre-CCR5 phase of infection is a narrow window of opportunity for neutralization of JR-FL by X5 Ab. Truncation of the gp160 cytoplasmic tail or addition of a disulfide bridge linking gp120 and gp41 did not increase X5 activity. Visualization of Env-Ab binding was conducted by BN-PAGE band shifts. Crooks *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **assay standardization/improvement**)

B Cell

- X5: The structure of the V3 region in the context of gp120 core complexed to the CD4 receptor and to the X5 Ab was determined by X-ray resolution. Comparison of free and bound X5 structure showed a large structural difference for the third complementary loop of the X5 heavy chain, representing one of the largest induced fits observed for an antibody. Accessibility of co-receptor binding site to this MAb is shown in a 3D figure. Huang *et al.* [2005a] (**antibody binding site definition and exposure**, **structure**)
- X5: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**, **review**)
- X5: Used as a positive control in an HIVRP assay to confirm specificity of the inhibition of viral and cellular membrane fusion by the screened scFvs. Miller *et al.* [2005]
- X5: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**, **review**)
- X5: This review summarizes data on 447-52D and 2219 crystallographic structures when bound to V3 peptides and their corresponding neutralization capabilities. X5, like 447-52D and like other HIV-1 neutralizing Abs, was shown to have long CDR H3 loop, which is suggested to help Abs access recessed binding sites on the virus. Stanfield & Wilson [2005] (**antibody binding site definition and exposure**, **review**, **structure**)
- X5: 93 viruses from different clades were tested for their neutralization cross-reactivity using a panel of HIV antibodies. X5 is a CD4i antibody and neutralized only the most sensitive B-clade envelopes in the pseudovirus assay, but was able to neutralize 2/25 non-B isolates in the PBMC assay, possibly due to differential corecptor expression. Binley *et al.* [2004] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- X5: The structure of the Fab X5 was determined at 1.9 angstrom resolution. The binding site is a long, 22 amino acid CDR H3 with a hook shape. Long CDR H3s are also found in IgG1b12 (18 residues) and 17b (19 residues). FAb X5 has a W100, F100Y in the CDR H3 hook shown to be important for binding through site specific mutagenesis. Compared to JRCSF, Ala substitutions at eight residues reduced binding more than 3 fold: C119, K207, G367, M426, W427, V430, I423, and K432. Only I423A and K432A were thought to possibly directly interact with X5, the other mutations were thought likely to disrupt the overall structure or CD4 binding. Darbha *et al.* [2004] (**antibody binding site definition and exposure**, **structure**)
- X5: This review summarizes MAbs directed to HIV-1 Env. There are six CD4 inducible MAbs and Fabs in the database. The MAb forms neutralize TCLA strains only, but the smaller Fabs and scFv fragments can neutralize primary isolates. Gorny & Zolla-Pazner [2004] (**review**)
- X5: Sera from two HIV+ people and a panel of MAbs were used to explore susceptibility to neutralization in the presence or absence of glycans within or adjacent to the V3 loop and within the C2, C4 and V5 regions of HIV-1 SF162 env gp120. The loss of the glycan within the V3 loop (GM299 V3) and two sites adjacent to V3, C2 (GM292 C2) and (GM329 C3), increased neutralization susceptibility to CD4i FAb X5, but each of the glycan mutants and SF162 were refractive to neutralization with 48d and 17b. The loss of sites in C4 (GM438 C4), or V5 (GM454 V5) did not increase neutralization susceptibility to FAb X5. V3 glycans tended to shield V3 loop, CD4 and co-receptor MAb binding sites, while C4 and V5 glycans shielded V3 loop, CD4, gp41 but not co-receptor MAb binding sites. Selective removal of glycans from a vaccine candidate may enable greater access to neutralization susceptible epitopes. McCaffrey *et al.* [2004] (**antibody binding site definition and exposure**, **vaccine antigen design**)
- X5: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including X5. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- X5: V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neturalization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12, which neutralized both strains), neutralized the SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype. Three CD4i MAbs were tested; all preferentially neutralized SF162, and JRFL became neutralization sensitive to CD4i Abs if the SF162 V1V2 loop was exchanged. FAb X5 could neutralize both viruses, but had reduced potency against JRFL. Pinter *et al.* [2004] (**variant cross-recognition or cross-neutralization**)
- X5: Called Fab X5. This paper is a study of the 2F5 NAb complexed to peptide ELDKWAS; the peptide was found to interact with amino acids near the base of the very long (22 residue) CDR 3H region of the Ab, although a Phe at the apex of the loop was also important. The authors suggest that particularly long CDR H3 regions may be a common feature of HIV-1 neuturalizing antibodies – there are 22 residues in 2F5's H3, 18 in b12's H3, and 22 residues in X5's H3. They ex-

press concern that because small animals like mice are unable to elicit Ab responses with such long H3s, they may be poor model systems for HIV vaccine studies. Zwick *et al.* [2004] (**antibody interactions**)

- X5: The SOS mutant envelope protein introduces a covalent disulfide bond between gp120 surface and gp41 transmembrane proteins into the R5 isolate JR-FL by adding cysteines at residues 501 and 605. Pseudovirions bearing this protein bind to CD4 and co-receptor bearing cells, but do not fuse until treatment with a reducing agent, and are arrested prior to fusion after CD4 and co-receptor engagement. CD4i Abs X5 and 17b were weakly neutralizing in all formats, WT, SOS, and when added postbinding. Binley *et al.* [2003] (**vaccine antigen design**)
- X5: This study shows the fragments of CD4i MAbs are better able to neutralize virus than whole IgG. Neutralization of HIV-1 R5 isolates JRFL, JR-CSF and ADA by CD4i MAbs X5, 17b, and 48d decreased with increased molecule size, the neutralizing potency of single-chain Fv (scFv) > than Fab fragments > whole Ab molecules. (With the exception of IgG 48d neutralization of HIV-1 ADA.) HIV-1 X4 isolates 89.6 and HxB2 are both relatively sensitive even to the larger IgG version. R5X4 isolate neutralization was dependent on the isolate and co-receptor usage. The CD4i MAb fragments neutralize HIV-1 subsequent to CD4 binding. The CD4i MAbs bind near the co-receptor binding sites on gp120. Co-receptors bind to the conserved beta19 strand and part of the V3 loop, regions that are masked by the V1V2 loops in the CD4-unbound state. When CD4 is bound, the co-receptor site is exposed near the membrane surface where it would be optimally accessible to co-receptors, and the smaller versions of the molecules are better able to overcome the steric hindrence. Labrijn *et al.* [2003] (**antibody binding site definition and exposure**, **co-receptor**, **variant cross-recognition or cross-neutralization**)
- X5: A gp120 molecule was designed to focus the immune response onto the IgG1b12 epitope. Ala substitutions that enhance the binding of IgG1b12 and reduce the binding of non-neutralizing MAbs were combined with additional N-linked glycosylation site sequons inhibiting binding of non-neutralizing MAbs; b12 bound to the mutated gp120. C1 and C5 were also removed, but this compromised b12 binding. Pantophlet *et al.* [2003b] (**vaccine antigen design**)
- X5: The Fab m18 was selected from a human phage display library by a new method called sequential antigen panning (SAP), using a series of antigens to screen the library to pick broadly cross-reactive isolates. The ability to block cell mediated fusion by m18 was compared to Fabs X5 and b12 for a clade A, CRF01 EA, G, and 6 clade B isolates, and the inhibitory activity of m18 was slightly lower but comparable to neutralizing Fabs b12 and X5. It also showed broad cross-neutralization; 11/15 pseudotyped Envs from primary isolates from clades A-F were inhibited in an IC50 assay at concentration less than or equal to 100 ug/ml; X5 was also tested and somewhat more potent, generally requiring lower concentrations and inhibiting 13/15 primary isolates. Zhang *et al.* [2003] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- X5: scFv 4KG5 reacts with a conformational epitope. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120. MAbs to the V2 loop, V3 loop, V3-C4 region, and CD4BS diminished binding, while MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected. This is a CD4i MAb that had no impact on 4KG5 binding. Zwick *et al.* [2003] (**antibody interactions**)
- X5: The human Fab X5 was selected from a phage display library derived from an HIV-1 positive donor with a highly neutralizing serum – it was selected for binding to purified gp120-CD4-coreceptor complexes – the Fab neutralizes PBMC infection by a selection of HIV-1 primary isolates from clades A, B, C, D, E, F, and G, and neutralizes R5, X4, and R5X4 isolates – it binds to a conserved epitope on gp120 induced by CD4 binding, its binding is slightly enhanced by CCR5 binding – while CD4i MAb 17b binds the CCR5 binding site, X5 also competes with Fab b12 which overlaps with the CD4 binding site, suggesting the epitope for is near both the CD4 and CCR5 binding sites. Moulard *et al.* [2002] (**antibody binding site definition and exposure**, **antibody generation**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)

- 8F101: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I and Cluster II MAbs required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor, binding to a fusion intermediate. 8F101 selectively stains gp120-CD4 complexes after dissociation from gp41, and did not stain cells arrested earlier than 30 min of co-culture, but 8F101 and cluster I and II MAbs co-localized at fusing cell interfaces at 30 min coculture. After extended co-culture, only 8F101 bound. Finnegan *et al.* [2002] (**antibody binding site definition and exposure**, **kinetics**)
- 8F101: Using a cell-fusion system, it was found CD4i antibodies 17b, 48d, and CG10 reacted faintly with Env expressing HeLA cells even in the absence of sCD4 or CD4 expressing target cells. Reactivity increased after sCD4 addition, but not after CD4 expressing target cell addition, and binding was not increased at the cell-to-cell CD4-Env interface. This suggests the CD4i co-receptor binding domain is largely blocked

B Cell

at the cell-fusion interface, and so CD4i antibodies would not be able access this site and neutralize cell-mediated viral entry. However, CD4i MAbs 8F101 and A32, that bind outside the co-receptor domain, had a different pattern. They reacted after the formation of gp120-CD4-CXCR4 tri-complexes, so co-receptor interactions allowed exposure of their epitopes. Finnegan *et al.* [2001] (**antibody binding site definition and exposure**)
- 8F101: MAbs specifically reactive to crosslinked gp120 and CD4 were derived (8F101, 8F102) – conformation dependent – competition studies indicate the epitope is immunogenic in infected humans. DeVico *et al.* [1995] (**antibody generation**)

Keywords antibody binding site definition and exposure, co-receptor, review

- 1357: This broad review of anti-Envelope MAbs notes that V2 MAbs are generally weakly neutralizing at best, and somewhat strain specific. Anti-V2 MAbs 1357, 1361, 1393 are non-neutralizing. Gorny & Zolla-Pazner [2004] (**review**)
- 1357: A pseudotyping assay showed that an X4 V3 loop peptide could enhance infectivity of X4 virus, R5 and R5X4 V3 loops peptides could enhance infectivity of an R5 virus, and R5X4 peptides could enhance infectivity of an R5X4 virus. Neither R5 nor R5X4 peptides influenced binding of CD4BS MAbs F105 and Ig1Gb12, but did increase binding of CD4i MAb 17b. Of three V2 MAbs, only 830A, not 2158 or 1357 was enhanced by V3 peptide binding. Ling *et al.* [2002] (**antibody binding site definition and exposure**, **co-receptor**)
- 1357: Blocks binding of MAb 697-D to rgp120, and doesn't react with a protein from which V1V2 has been deleted – binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, though anti-V3 and CD4BS MAbs reacted better with the oligomer and V2 and C5 tended to favor the monomer – V2 MAbs 697-D, 1357 and 1361 favored the monomer by approximately 2 fold. Gorny *et al.* [2000]
- 1357: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 5 anti-V2 MAbs, which showed weak and sporadic binding, with the most frequent binding to C and D clades. Nyambi *et al.* [2000]
- 1357: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 5 anti-V2 MAbs, which showed weak and sporadic binding, with the most frequent binding to C and D clades. Nyambi *et al.* [2000]
- 1357: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – V2 Abs 697-D, 1361, and 1357 tended to bind very weakly with a similar pattern of specificity to virions, but bound well to soluble gp120: weak binding only to subtype D MAL. Nyambi *et al.* [1998]

- 2158: The role of serine proteases on HIV infection was explored. Trypsin decreased the binding of most Env MAb tested and diminished cell fusion of H9 cells infected with HIV-1 LAI virus (H9/IIIB) to MAGI cells. In contrast, thrombin increased the binding of MAbs to gp120 epitopes near the CD4 and CCR5 binding sites, and increased cell fusion. Binding of 17b and F105 was decreased by trypsin, but increased by thrombin. V2 MAbs 830A and 2158 were decreased by trypsin, uneffected by thrombin. Thrombin may increase HIV-induced cell fusion in blood by causing a conformational activating shift in gp120. Ling *et al.* [2004] (**antibody binding site definition and exposure**)
- 2158: V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neturalization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12, which neutralized both strains), neutralized the SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype. Three anti-V2 MAb were tested – both 2158 and 830A bound more strongly to JRFL, but neutralized SF162, and not neutralize JRFL. Thus V2 domains are better neutralization targets in SF162. Pinter *et al.* [2004] (**variant cross-recognition or cross-neutralization**)
- 2158: A pseudotyping assay showed that an X4 V3 loop peptide could enhance infectivity of X4 virus, R5 and R5X4 V3 loops peptides could enhance infectivity of an R5 virus, and R5X4 peptides could enhance infectivity of an R5X4 virus. Neither R5 nor R5X4 peptides influenced binding of CD4BS MAbs F105 and Ig1Gb12, but did increase binding of CD4i MAb 17b. - 830A: 2909 is a human anti-Env NAb that was selected by neutralization assay and binds to the quaternary structure on the intact virion. ELISA-based competition assays and subsequent mutational analysis determined that the CD4BS and V2 and V3 loops contribute to the 2909 epitope: 2909 binding was inhibited by MAbs 447-52d (anti-V3), 830A (anti-V2), and IgG1b12 (anti-CD4BS) and sCD4. 2909 was not inhibited by MAbs 670, 1418, nor 2G12. Gorny *et al.* [2005]
- 830A: This broad review of anti-Envelope MAbs notes that V2 MAbs are generally weakly neutralizing at best, and somewhat strain specific. 830A neutralizes SF162. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization**, **review**)
- 830A: The role of serine proteases on HIV infection was explored. Keywords antibody binding site definition and exposure, binding affinity, review, variant cross-recognition or cross-neutralization

- L17: In a review of Envelope binding MAbs in this database, V2-specific MAbs are noted to have some ability to neutralize HIV-1, but generally weakly with limited cross-reactivity. L15 and L17 are Fabs specific for V2. Gorny & Zolla-Pazner [2004] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **review**)
- L17: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-2999) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)
- L17: The rank order of Fab binding affinity to monomeric gp120 (Loop 2 > 3B3 > b12 = DO8i > b11 > b3 > b14 > b13 > DO142-10 > DA48 > L17) was markedly different than Fab binding affinity to the mature oligomeric form (3B3 > b12 > DO142-10 > Loop 2 > b11 > L17 > b6 > DO8i > b14 > DA48 > b3 > b13) and binding to oligomeric form and neutralization were correlated for both Fabs and MAbs – authors suggest that neutralization is determined by the fraction of Ab sites occupied on a virion irrespective of the epitope. Parren *et al.* [1998a] (**binding affinity**)

- L40: In a review of Envelope binding MAbs in this database, V2-specific MAbs are noted to have some ability to neutralize HIV-1, but generally weakly with limited cross-reactivity. L25, L39, L40 and L78 are Fabs specific for a complex binding site involving V2 and elements of the sCD4 binding site regions; among these only L25 and L78 mediate weak neutralization of some TCLA strains. Gorny & Zolla-Pazner [2004] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **responses in children**)
- L40: This Fab does not inhibit sCD4 binding, but is inhibited by sCD4, probably due to conformational changes – it is competed by anti-V2 MAbs, and sensitive to amino acid substitutions in the V3 loop (similar patterns were observed for L40 and L78 gp120 amino acid substitutions enhancing or reducing binding) – does not compete with CD4BS MAbs, but is sensitive to amino acid changes at positions 368 and 370 – binding only partially affected by deglycosylation – reciprocal inhibition with V2 MAbs SC258 and 684-238 – heavy and light chain variable region sequence is available. Ditzel *et al.* [1995]

- L78: In a review of Envelope binding MAbs in this database, V2-specific MAbs are noted to have some ability to neutralize HIV-1, but generally weakly with limited cross-reactivity. L25, L39, L40 and L78 are Fabs specific for V2 that are also associated with sCD4 binding site regions; among these only L25 and L78 mediate weak neutralization of some TCLA strains. Gorny & Zolla-Pazner [2004] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **review**)

- L78: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-2999) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)
- L78: Substitutions at V2: (152/153 GE/SM, 183/184 PI/SG, 191/193 YL/GS), 262 N/T, V3 (314 G/W), CD4BS (257 T/R, 368 D/R, 370 E/R) inhibit binding, and some C4 and C5 substitutions enhance binding – this Fab does not inhibit sCD4 binding, but is inhibited by sCD4, probably due to conformational changes – it is competed by anti-V2 MAbs, and sensitive to amino acid substitutions in the V3 loop – does not compete with CD4BS MAbs, but is sensitive to amino acid changes at positions 368 and 370 – Fab neutralizes MN and LAI – binding unaffected by deglycosylation – reciprocal inhibition with V2 MAbs SC258 and 684-238 – heavy and light chain variable region sequence is available. Ditzel *et al.* [1995] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **antibody sequence variable domain**)

- Sera from individuals with infections of HIV-1 subtype A-E were tested against purifed proteins from primary PBMC cultures. Sera reactivity tended not to be strongly related to subtype, rather probably reflected the sum of reactivities to conserved and variable regions in the proteins. V3 peptide comparisons showed some preference for within subtype binding. Gilljam *et al.* [1999]

- 2182: This review summarizes 2182 Ab epitope, properties and neutralization activity. Kramer *et al.* [2007] (**review**)
- 2182: This MAb was derived from plasma from a patient with env clade A virus with the GPGR V3 motif. When cross-reactivity was tested, this Ab bound only the V3subtypeB-fusion protein containing GPGR motif and not V3subtypeA-fusion protein containing GPGQ motif. This Ab was also shown to be able to neutralize clade B psSF162 (GPGR) but not clade C psMW965 (GPGQ) virus and to neutralize subtype B primary isolates but not non-B primary isolates. Gorny *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **subtype comparisons**)
- 2182: This Ab was shown to neutralize SF162 and the neutralization sensitivity increased in the SF162 variant with a JR-FL V3 loop, SF162(JR-FL V3). In contrast, no neutralization was observed of the SF162(JR-FL V1/V2) variant and was somewhat restored in the SF162(JR-FL V1/V2/V3) variant, indicating that the masking of the V1/V2 loop plays a much greater role in restricting neutralization sensitivity than the variations in V3. This Ab did not neutralize viruses with V3 sequences from several different subtypes (B, F, A1, H, C, CRF02_AG and CRF01_AE) and also failed to neutralize SF162(JR-FL V1/V2) with V3 derived from different HIV-1 clades. The effect on the neutralization sensitivity of the residue at the crown of the V3 loop (position 18) was shown to be great for this Ab. Krachmarov *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2182: Full-length gp160 clones were derived from acute and early human HIV-1 infections and used as env-pseudotyped viruses in neutralization assays for their characterization as neutralization reference agents. 2 out of 19 pseudoviruses were sensitive to neutralization by 2182, as was the SF162.LS strain. Li *et al.* [2005a] (**neutralization**, **assay standardization/improvement**)
- 2182: This review focuses on the importance of neutralizing Abs in protecting against HIV-1 infection, including mechanisms of Ab interference with the viral lifecycle, Ab responses elicited during natural HIV infection, and use of monoclonal and polyclonal Abs in passive immunization. In addition, vaccine design strategies for eliciting of protective broadly neutralizing Abs are discussed. MAbs included in this review are: 2F5, Clone 3 (CL3), 4E10, Z13, IgG1b12, 2G12, m14, 447-52D, 17b, X5, m16, 47e, 412d, E51, CM51, F105, F425, 19b, 2182, DO142-10, 697-D, 448D, 15e and Cβ1. Mc Cann *et al.* [2005] (**antibody binding site definition and exposure**, **review**)
- 2182: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**neutralization**, **variant cross-recognition or cross-neutralization**, **review**, **subtype comparisons**)
- 2182: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. The set that can cross-neutralize primary isolates (2182, 2191, 2219, 2412, 2442, 2456) bind V3 but are conformationally senstitive, suggesting some structural conservation despite sequence variation. These MAbs have distinct epitopes relative to 447-52D, a MAb directed at the tip of the V3 loop that also can neutralize many primary isolates. Inter-clade cross-neutralization by these anti-V3 MAbs is reduced. Gorny & Zolla-Pazner [2004] (**review**, **subtype comparisons**)
- 2182: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using a JR-CSF fusion protein, and could neutralize 6/13 B clade viruses. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 2182: V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neturalization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12, which neutralized both strains), neutralized the

B Cell

SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype. 5/6 anti-V3 MAbs had similar binding affinity to soluble SF162 and JR-FL rgp120s, although the V3 loop differs at three positions (HigpgrafyTtgE for JR-FL and TigpgrafyAtgD for SF162). Only the V3 MAb that had a different affinity was 2182, which bound to JRFL with higher affinity. Even 2182 preferentially neutralized SF162, however, the JRFL gp120 backbone with the SF162 V1V2 region was the more neutralization sensitive than pure SF162. Pinter *et al.* [2004] (**variant cross-recognition or cross-neutralization**)

- 2182: Conformation-dependent anti-V3 loop Abs may be more cross-reactive, so six new V3 MAbs were generated from cells of asymptomatic HIV-1-infected individuals by selection of heterhybridomas using a V3-fusion protein (V3-fp), the HIV-1 JRCSF V3 loop inserted into a truncated murine leukemia virus gp70 – the six new MAbs all bind to the tip of the V3 loop and cross-compete with the MAb 447-52D and are conformationally sensitive – MAbs showed cross-clade binding to native, intact virions of clades A(N=2), B(N=4), and F(N=2), limited binding to C(N=3) and D(N=3), and did not bind to CRF01(subtype E, N=2) – the strength binding was highly correlated with percent neutralization using the ghost cell or PHA blast assay – five well-characterized MAbs were used as controls: anti-V3 447-52D (anti-V3 MAb for competition and neutralization studies), 654 (anti-CD4BS used as a conformation-sensitive MAb control), 1331A (anti-C5 used as a linear binding site MAb control), MAb 246 (anti-gp41 MAb that bound to primary isolates of all clades) – 5/6 MAbs were derived from individuals infected in the US, presumably with clade B, and one, 2182, was derived from an individual who was infected abroad with clade A who is presently living in New York city – 2412 and 2456 were produced from cells obtained from the same individual, while the other MAbs were each generated from different subjects – 2182 bound to 8/16 of the diverse isolates, not to any clade C or CRF01. Gorny *et al.* [2002] (**antibody binding site definition and exposure**, **antibody generation**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)

- 2191: This MAb was derived from plasma from a patient with env clade B virus with the GPGR V3 motif. When cross-reactivity was tested, this Ab bound to the V3subtypeB-fusion protein containing GPGR motif but not to V3subtypeA-fusion protein containing GPGQ motif. This Ab was also shown to be able to neutralize both clade B psSF162 (GPGR) and clade C psMW965 (GPGQ) virus and three of subtype B and three non-B primary isolates. Gorny *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **subtype comparisons**)
- 2191: This Ab was shown to equally neutralize SF162 and the SF162 variant with a JR-FL V3 loop, SF162(JR-FL V3). In contrast, a reduction in sensitivity to neutralization was observed in the SF162(JR-FL V1/V2) variant and was somewhat restored in the SF162(JR-FL V1/V2/V3) variant, indicating that the masking of the V1/V2 loop plays a much greater role in restricting neutralization sensitivity than the variations in V3. This Ab was shown to neutralize viruses with V3 sequences from several different subtypes (B, F, A1, C and CRF02_AG) except subtypes H and CRF01_AE. This Ab failed to neutralize SF162(JR-FL V1/V2) with V3 derived from different HIV-1 clades indicating effective V1/V2-mediated masking of several HIV-1 clades. The effect on the neutralization sensitivity of the residue at the crown of the V3 loop (position 18) was shown to be low for this Ab. Krachmarov *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2191: Full-length gp160 clones were derived from acute and early human HIV-1 infections and used as env-pseudotyped viruses in neutralization assays for their characterization as neutralization reference agents. 3 out of 19 pseudoviruses were sensitive to neutralization by 2191, as was the SF162.LS strain. Two additional pseudoviruses were sensitive at higher Ab concentrations. Li *et al.* [2005a] (**neutralization**, **assay standardization/improvement**)
- 2191: This study is about the V2 MAb C108g, that is type-specific and neutralizes BaL and HXB2. JR-FL is a neutralization resistant strain; modification of JRFL at V2 positions 167 and 168 (GK->DE) created a C108g epitope, and C108g could potently neutralize the modified JR-FL. The modification in V2 also increased neutralization sensitivity to V3 MABs 4117c, 2219, 2191, and 447-52D, but only had minor effects on neutralization by CD4BS MAb 5145A, and broadly neutralizing MAbs IgG1b12, 2G12, and 2F5. Pinter *et al.* [2005] (**antibody binding site definition and exposure**)
- 2191: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. The set that can cross-neutralize primary isolates (2182, 2191, 2219, 2412, 2442, 2456) bind V3 but are conformationally senstitive, suggesting some structural conservation despite sequence variation. These MAbs have distinct epitopes relative to 447-52D, a MAb directed at the tip of the V3 loop that also can neutralize many primary isolates. Interclade cross-neutralization by these anti-V3 MAbs is reduced. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization**, **review**, **subtype comparisons**)

- 2219: Angle of interaction between 2219 and V3 was shown by superimposing the Fab fragment of the Ab with V3. Pantophlet *et al.* [2008] (**antibody binding site definition and exposure**, **structure**)
- 2219: To test whether the conformation change of Env induced by CD4 affects the breadth and potency of 2219 neutralization, 2219 was tested in the presence or absence of sCD4 in neutralization of a panel of 12 subtype B and 12 subtype C Env-pseudoviruses. Without sCD4, 2219 neutralized 2 subtype B and 0 subtype C viruses. With sCD4 present, 2219 neutralized 9 subtype B and 1 subtype C virus, indicating that neutralization resistance of some viruses to 2219 is due to a lack of exposure of the V3 loop. Neutralization of JRFL, ADA, and YU2 isolates by 2219 increased with increased dose of sCD4. Wu *et al.* [2008] (**neutralization**, **variant cross-recognition or cross-neutralization**)
- 2219: 2219 structure, binding, neutralization, and strategies that can be used for vaccine antigen design to elicit anti-V3 Abs, are reviewed in detail. Lin & Nara [2007] (**review**)
- 2219: Data is summarized on the X-ray crystal structures resolution and NMR studies of 2219. Sirois *et al.* [2007] (**review**, **structure**)
- 2219: This MAb was derived from plasma from a patient with env clade B virus with the GPGR V3 motif. When cross-reactivity was tested, this Ab bound to the V3subtypeB-fusion protein containing GPGR motif and to V3subtypeA-fusion protein containing GPGQ motif. This Ab was also shown to be able to neutralize both clade B psSF162 (GPGR) and clade C psMW965 (GPGQ) virus and three of subtype B but only one of non-B primary isolates. Gorny *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2219: This Ab was shown to neutralize SF162 and the neutralization sensitivity increased somewhat in the SF162 variant with a JR-FL V3 loop, SF162(JR-FL V3). In contrast, a great reduction in sensitivity to neutralization was observed in the SF162(JR-FL V1/V2) variant and was somewhat restored in the SF162(JR-FL V1/V2/V3) variant, indicating that the masking of the V1/V2 loop plays a much greater role in restricting neutralization sensitivity than the variations in V3. This Ab was shown to neutralize viruses with V3 sequences from several different subtypes (B, F, A1, C, CRF02_AG,

B Cell

CRF01_AE and H). This Ab failed to neutralize SF162(JR-FL V1/V2) with V3 derived from different HIV-1 clades indicating effective V1/V2-mediated masking of several HIV-1 clades. The effect on the neutralization sensitivity of the residue at the crown of the V3 loop (position 18) was shown to be low for this Ab. Krachmarov *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)

- 2219: Structure of 2219 Ab in contact with three different V3 peptides was determined in order to gain insight in the structural basis for its cross-reactivity with different HIV-1 clades. It is shown that Fab 2219 binds to one face of the variable V3 beta-hairpin, primarily contacting conserved residues, leaving the V3 crown largely accessible. Twisting of the V3 loop is shown to alter the relative dispositions and pairing of amino acids. 2219 was shown to cross-react with V3 sequences from clades A, B and C and to neutralize viruses from clades A, B and F. Stanfield *et al.* [2006] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**, **structure**)
- 2219: Full-length gp160 clones were derived from acute and early human HIV-1 infections and used as env-pseudotyped viruses in neutralization assays for their characterization as neutralization reference agents. 4 out of 19 pseudoviruses were sensitive to neutralization by 2219, as was the SF162.LS strain. One additional pseudovirus was sensitive at higher Ab concentrations. Li *et al.* [2005a] (**neutralization**, **assay standardization/improvement**)
- 2219: This study is about the V2 MAb C108g, that is type-specific and neutralizes BaL and HXB2. JR-FL is a neutralization resistant strain; modification of JRFL at V2 positions 167 and 168 (GK->DE) created a C108g epitope, and C108g could potently neutralize the modified JR-FL. The modification in V2 also increased neutralization sensitivity to V3 MABs 4117c, 2219, 2191, and 447-52D, but only had minor effects on neutralization by CD4BS MAb 5145A, and broadly neutralizing MAbs IgG1b12, 2G12, and 2F5. Binding to CCR5 was completely inhibited by two V3 MAbs, 4117C and 2219, and was substantially inhibited by 2G12, but was not inhibited by C108g. Pinter *et al.* [2005] (**antibody binding site definition and exposure**)
- 2219: This review summarizes data on 2219-V3 and 2219-V3 peptide X-ray crystallographic structures and its neutralization capabilities. The binding mechanism of this Ab to V3 explains its ability to neutralize a wide array of HIV-1 primary isolates from different clades. Stanfield & Wilson [2005] (**antibody binding site definition and exposure**, **neutralization**, **variant cross-recognition or cross-neutralization**, **review**, **structure**)
- 2219: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. The set that can cross-neutralize primary isolates (2182, 2191, 2219, 2412, 2442, 2456) bind V3 but are conformationally senstitive, suggesting some structural conservation despite sequence variation. These MAbs have distinct epitopes relative to 447-52D, a MAb directed at the tip of the V3 loop that also can neutralize many primary isolates. Interclade cross-neutralization by these anti-V3 MAbs is reduced. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization**, **review**, **subtype comparisons**)
- 2219: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using a JR-CSF fusion protein, and could neutralize 6/13 B clade viruses. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)
- 2219: V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neturalization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12, which neutralized both strains), neutralized the SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype. 5/6 anti-V3 MAbs, including 2219, had similar binding affinity to soluble SF162 and JR-FL rgp120s, although the V3 loop differs at three positions (HigpgrafyTtgE for JR-FL and TigpgrafyAtgD for SF162). Pinter *et al.* [2004] (**variant cross-recognition or cross-neutralization**)
- 2219: Conformation-dependent anti-V3 loop Abs may be more cross-reactive, so six new V3 MAbs were generated from cells of asymptomatic HIV-1-infected individuals by selection of heterhybridomas using a V3-fusion protein (V3-fp), the HIV-1 JRCSF V3 loop inserted into a truncated murine leukemia virus gp70 – the six new MAbs all bind to the tip of the V3 loop and cross-compete with the MAb 447-52D and are conformationally sensitive – MAbs showed cross-clade binding to native, intact virions of clades A(N=2), B(N=4), and F(N=2), limited binding to C(N=3) and D(N=3), and did not bind to CRF01(subtype E, N=2) – the strength binding was highly correlated with percent neutralization using the ghost cell or PHA blast assay – five well-characterized MAbs were used as controls: anti-V3 447-52D (anti-V3 MAb for competition and neutralization studies), 654 (anti-CD4BS used as a conformation-sensitive MAb control), 1331A (anti-C5 used as a linear binding site MAb control), MAb 246 (anti-gp41 MAb that bound to primary isolates of all clades) – 5/6 MAbs were derived from individuals infected in the US, presumably with clade B, and one, 2182, was derived from an individual who was infected abroad with clade A who is presently living in New York city – 2412 and 2456 were produced from cells obtained from the same individual, while the other MAbs were each generated from different subjects – 2219 bound to 13/16 of the diverse isolates. Gorny *et al.* [2002] (**antibody binding site definition and exposure**, **antibody generation**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)

- 2412: This MAb was derived from plasma from a patient with env clade B virus with the GPGR V3 motif. When cross-reactivity was tested, this Ab bound to the V3subtypeB-fusion protein containing GPGR motif but not to V3subtypeA-fusion protein containing GPGQ motif. This Ab was also shown to be able to neutralize clade B psSF162 (GPGR) but not clade C psMW965 (GPGQ) virus, and three of subtype B but only two of non-B primary isolates. Gorny *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **subtype comparisons**)
- 2412: This Ab was shown to neutralize SF162 and the neutralization sensitivity increased in the SF162 variant with a JR-FL V3 loop, SF162(JR-FL V3). In contrast, no neutralization was observed of the SF162(JR-FL V1/V2) variant and was somewhat restored in the SF162(JR-FL V1/V2/V3) variant, indicating that the masking of the V1/V2 loop plays a much greater role in restricting neutralization sensitivity than the variations in V3. This Ab was shown to neutralize viruses with V3 sequences from several different subtypes (B, F, and A1) except subtypes C, CRF02_AG, H and CRF01_AE. This Ab failed to neutralize SF162(JR-FL V1/V2) with V3 derived from different HIV-1 clades indicating effective V1/V2-mediated masking of several HIV-1 clades. The effect on the neutralization sensitivity of the residue at the crown of the V3 loop (position 18) was shown to be great for this Ab. Krachmarov *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)

This Ab failed to neutralize SF162(JR-FL V1/V2) with V3 derived from different HIV-1 clades except A1, indicating effective V1/V2-mediated masking of several HIV-1 clades. The effect on the neutralization sensitivity of the residue at the crown of the V3 loop (position 18) was shown to be low for this Ab. Krachmarov *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2442: This Ab was used as a control in a peptide adsorption assay. 2442 neutralized the SF162 primary isolate to 99%. When 2442 was pre-incubated with BaL or YU2 V3 loop peptides, nearly all neutralizing activity was inhibited. Grundner *et al.* [2005] (**neutralization**)
- 2442: Full-length gp160 clones were derived from acute and early human HIV-1 infections and used as env-pseudotyped viruses in neutralization assays for their characterization as neutralization reference agents. 3 out of 19 pseudoviruses were sensitive to neutralization by 2442, as was the SF162.LS strain. Li *et al.* [2005a] (**neutralization**, **assay standardization/improvement**)
- 2442: Pseudoviruses expressing HIV-1 envelope glycoproteins from BL01, BR07 and 89.6 strains were compared in neutralization assays to replication competent clone derived from transfection of 293T cells (IMC-293T) and to the IMC-293T derived from a single passage through PBMC (IMC-PBMC). The neutralization responses of pseudoviruses and corresponding IMC-293T to 2442 were similar, while a significant decrease in viral neutralization sensitivity to 2442 was observed the 89.6 IMC-PBMC virus. The decrease was associated with an increase in average virion envelope glycoprotein content on the PBMC-derived virus. Louder *et al.* [2005] (**neutralization**, **assay standardization/improvement**)
- 2442: This review provides summaries of Abs that bind to HIV-1 Env. There are many V3 MAbs, many neutralize some TCLA strains, and a subset can also neutralize some primary isolates. The set that can cross-neutralize primary isolates (2182, 2191, 2219, 2412, 2442, 2456) bind V3 but are conformationally senstitive, suggesting some structural conservation despite sequence variation. These MAbs have distinct epitopes relative to 447-52D, a MAb directed at the tip of the V3 loop that also can neutralize many primary isolates. Interclade cross-neutralization by these anti-V3 MAbs is reduced. Gorny & Zolla-Pazner [2004] (**variant cross-recognition or cross-neutralization**, **review**)
- 2442: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This MAb was selected using a JR-CSF fusion protein, and could neutralize 9/13 B clade viruses. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)

- 2557: This MAb was derived from plasma from a patient with env clade A virus with the GPGQ V3 motif. When cross-reactivity was tested, this Ab bound to both the V3subtypeB-fusion protein containing GPGR motif and V3subtypeA-fusion protein containing GPGQ motif. This Ab was also shown to be able to neutralize both clade B psSF162 (GPGR) and clade C psMW965 (GPGQ) virus and the majority of subtype B and non-B primary isolates. Gorny *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **subtype comparisons**)
- 2557: This Ab was shown to neutralize SF162 and the neutralization sensitivity increased in the SF162 variant with a JR-FL V3 loop, SF162(JR-FL V3). In contrast, a great reduction in sensitivity to neutralization was observed in the SF162(JR-FL V1/V2) variant and was somewhat restored in the SF162(JR-FL V1/V2/V3) variant, indicating that the masking of the V1/V2 loop plays a much greater role in restricting neutralization sensitivity than the variations in V3. This Ab was shown to neutralize viruses with V3 sequences from several different subtypes (B, F, A1, H, C, CRF02_AG and CRF01_AE). This Ab failed to neutralize SF162(JR-FL V1/V2) with V3 derived from different HIV-1 clades except A1, indicating effective V1/V2-mediated masking of several HIV-1 clades. The effect on the neutralization sensitivity of the residue at the crown of the V3 loop (position 18) was shown to be low for this Ab. Krachmarov *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2557: Sera from subtype A infected individuals from Cameroon have antibodies that react strongly with subtype A and subtype B V3 loops in fusion proteins, and neutralize SF162 pseudotypes, while sera from 47 subtype B infected individuals reacted only with subtype B V3s. Sera from Cameroon did not neutralize primary A or B isolates, due to indirect masking by the V1/V2 domain rather than due to loss of the target epitope. 2557 was derived from a person infected with a clade A or CRF02 virus, and binds to A and B V3 loops. Neutralization of JR-FL and SF162(UG V3) by anti-V3 MAbs 2557, 2558, 2601, but not subtype A primary isolates despite binding to the subtype A V3 loops, suggested masking by V1V2 blocking of neutralization by these antibodies. Krachmarov *et al.* [2005] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2557: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This antibody was selected using a JRCSF fusion protein. Gorny *et al.* [2004]

- 2558: This MAb was derived from plasma from a patient with env clade A virus with the GPGQ V3 motif. When cross-reactivity was tested, this Ab bound to both the V3subtypeB-fusion protein containing GPGR motif and V3subtypeA-fusion protein containing GPGQ motif. This Ab was also shown to be able to neutralize both clade B psSF162 (GPGR) and clade C psMW965 (GPGQ) virus and the majority of subtype B and non-B primary isolates. Gorny *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **subtype comparisons**)

B Cell

- 2558: This Ab was shown to neutralize SF162 and the neutralization sensitivity increased in the SF162 variant with a JR-FL V3 loop, SF162(JR-FL V3). In contrast, no neutralization was observed of the SF162(JR-FL V1/V2) variant and was somewhat restored in the SF162(JR-FL V1/V2/V3) variant, indicating that the masking of the V1/V2 loop plays a much greater role in restricting neutralization sensitivity than the variations in V3. This Ab was shown to neutralize viruses with V3 sequences from several different subtypes (B, F, A1, H, C, CRF02_AG and CRF01_AE). This Ab failed to neutralize SF162(JR-FL V1/V2) with V3 derived from CRF02_AG but not A1 and C, indicating effective V1/V2-mediated masking of somel HIV-1 clades. The effect on the neutralization sensitivity of the residue at the crown of the V3 loop (position 18) was shown to be low for this Ab. Krachmarov *et al.* [2006] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2558: Sera from subtype A infected individuals from Cameroon have antibodies that react strongly with subtype A and subtype B V3 loops in fusion proteins, and neutralize SF162 pseudotypes, while sera from 47 subtype B infected individuals reacted only with subtype B V3s. Sera from Cameroon did not neutralize primary A or B isolates, due to indirect masking by the V1/V2 domain rather than due to loss of the target epitope. 2557 was derived from a person infected with a clade A or CRF02 virus, and binds to A and B V3 loops. Neutralization of JR-FL and SF162(UG V3) by anti-V3 MAbs 2557, 2558, 2601, but not subtype A primary isolates despite binding to the subtype A V3 loops, suggested masking by V1V2 blocking of neutralization by these antibodies. Krachmarov *et al.* [2005] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 2558: V3 MAb neutralization is influenced by retaining the epitope, exposure on the intact virion, mobility during CD4-induced conformational change, and affinity. Anti-V3 MAbs selected using V3 peptides neutralize less effectively than V3 MAbs selected using fusion proteins or gp120, suggesting antigenic conformation is important. This antibody was selected using an A clade fusion protein, 92UG037. It is unusual in that it is a V3 antibody selected for conformational aspects using an A clade virus, with a V3 GPGQ tip – clade B viruses are usually used and have GPGR tips. It cross-neutralizes and binds B clade HIV SF162. Gorny *et al.* [2004] (**antibody binding site definition and exposure**)

Keywords antibody binding site definition and exposure, antibody interactions, binding affinity, co-receptor, enhancing activity, kinetics, neutralization, review, structure, subtype comparisons, vaccine antigen design, vaccine-specific epitope characteristics, variant cross-recognition or cross-neutralization

- 39F: 24 broadly neutralizing plasmas from HIV-1 subtype B and C infected individuals were investigated using a series of mapping methods to identify viral epitopes targeted by NAbs. V3 Ab activity was measured by the abilities of the plasmas to inhibit capture of JR-FL virus particles by 39F. Modest titers were exhibited by subtype B plasmas, while subtype C plasmas showed lower activities, suggesting subtype-specific V3 loop binding. Binley *et al.* [2008] (**neutralization**, **subtype comparisons**)
- 39F: 39F neutralized two of the 15 subtype B isolates tested, 93TH305 and 92BR020c. Binding affinity of MAb 39F to gp120 was strongly reduced upon substitutions of Lys305 or Ile307 to Ala, and was moderately reduced upon substitutions of Ser306 and Ile309. Substitutions of Arg298 or Arg304 also diminished binding but not substantially, indicating that 39F interacts principally with the N-terminal flank of the V3 loop. Of the 13 viruses that were not neutralized by 39F, the resistance of 6 viruses could be explained by substitutions at important contact residues, while neutralization resistance of 7 viruses could not be explained by this. The fine specificity of 39F was mapped onto V3 in the structural context of gp120. Residues Lys305, Ser306, Ile307, and Ile309 form a distinct binding site on the N-terminal flank of V3, supporting the indication that 39F interacts with the N-terminal part of V3. Pantophlet *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **variant cross-recognition or cross-neutralization**, **binding affinity**, **structure**)
- 39F: In order to assess whether small molecule CCR5 inhibitor resistant viruses were more sensitive to neutralization by NAbs, two escape mutant viruses, CC101.19 and D1/85.16, were tested for their sensitivity to neutralization by 39F, compared to the sensitivity of CC1/85 parental isolate and the CCcon.19 control isolate. The CC101.19 escape mutant has 4 sequence changes in V3 while the D1/85.16 has no sequence changes in V3 and relies on other sequence changes for its resistance. None of the control or resistant viruses were sensitive for neutralization by 39F, although 39F bound strongly to gp120 from CC1/85. These results indicate that V3-dependent and -independent changes responsible for CCR5 inhibitor resistance do not necessarily alter the exposure of V3 to some of the V3 Abs. Pugach *et al.* [2008] (**co-receptor**, **neutralization**, **binding affinity**)
- 39F: Sera from both gp120 DNA prime-protein boost immunized rabbits and from protein-only immunized rabbits competed for binding to 39F, indicating elicitation of 39F-like Abs by both immunization regimens. Competitive virus capture assay revealed higher titers of 39F-like Abs in animals immunized with DNA prime-protein boost than in protein-only immunized animals. Vaine *et al.* [2008] (**vaccine antigen design**)
- 39F: Guinea pigs were immunized with gp120 protein, or with three types of VLPs containing disulfide-shackled functional trimers (SOS-VLP), uncleaved nonfunctional Env (UNC-VLP), naked VLP bearing no Env. 39F was used in a capture assay showing that most of the SOS-VLP and UNC-VLP sera contained high titers of anti-V3 Abs. gp120 sera showed only moderate titers of V3 competing Abs. Crooks *et al.* [2007] (**neutralization**)
- 39F: This review summarizes data on the development of HIV-1 centralized genes (consensus and ancestral) for induction of neutralizing antibody responses. Functionality and conformation of native epitopes in proteins based on the centralized genes was tested and confirmed by binding to 39F and other MAbs. Gao *et al.* [2007] (**antibody binding site definition and exposure**, **review**)
- 39F: 29 subtype B V3 peptides were designed and used for immunization of guinea pigs. Peptides that induced Abs that neutralized more than 3 HIV isolates were shown to bind to this Ab better than peptides unable to induce neutralization of any of the HIV-1 primary isolates. Haynes *et al.* [2006] (**neutralization**, **binding affinity**)
- 39F: The gp140δCFI protein of CON-S M group consensus protein and gp140CFI and gp140CF proteins of CON6 and WT viruses from HIV-1 subtypes A, B and C were expressed in recombinant vaccinia viruses and tested as immunogens in guinea pigs. 39F was shown to bind specifically to all recombinant proteins except for the gp140δFI derived from subtype C virus. The specific binding of this Ab to CON-S indicated that its conformational epitope was intact. 39F also bound specifically to the two subtype B gp120 proteins tested. Liao *et al.* [2006] (**antibody binding site definition and exposure**, **vaccine antigen design**, **subtype comparisons**)
- 39F: Interactions of this Ab with gp120 monomer and two cleavage-defective gp140 trimers were studied. It was shown that 39F interactions with the soluble monomers and trimers were minimally affected by GA cross-linking of the proteins, indicating that the 39F epitope was maintained after cross-linking. This Ab was associated with a small entropy change upon gp120 binding. This Ab was shown to have a kinetic advantage as it bound to gp120 faster than other less neutralizing Abs. 39F sucsesfully recognized untreated trimers and monomer expressed on cell surfaces but this recognition was decreased by cross-linking indicating that differences exist between the soluble trimers and native proteins. Yuan *et al.* [2006] (**antibody binding site definition and exposure**, **antibody interactions**, **kinetics**, **binding affinity**)
- 39F: R-FL and YU2 HIV-1 strains were not neutralized by39F. 39F and other non-neutralizing Abs only recognized JR-FL cleavage-defective glycoproteins, while the neutralizing Abs (2G12 and IgG1b12) recognized both cleavage competent and cleavage-defective glycoproteins. It is suggested that an inefficient env glycoprotein precursor cleavage exposes non-neutralizing determinants, while only neutralizing regions remain accessible on efficiently cleaved spikes. For YU2, both cleavage-competent and -defective glycoproteins were recognized by both neutralizing and non-neutralizing Abs. 39F, along with other Abs able to neutralize lab-adapted isolates, displayed enhanced viral entry at higher Ab concentrations, whereas the Abs that cannot neutralize any virus did not display such enhancement. Pancera & Wyatt [2005] (**antibody**

B Cell

binding site definition and exposure, **enhancing activity**, **neutralization**, **binding affinity**)

- 39F: A stable trimerization motif, GCN4, was appended to the C terminus of YU2gp120 to obtain stable gp120 trimers (gp120-GCN4). Each trimer subunit was capable of binding IgG1b12, indicating that they were at least 85% active. D457V mutation in the CD4 binding site resulted in a decreased affinity of the gp120-GCN4 for CD4, but the mutation did not affect binding of 39F. 39F was able to bind to both wildtype gp120, gp120-GCN4, and to the respective corresponding mutant molecules D457Vgp120 and D457Vgp120-GCN4 with the similar affinities. Pancera *et al.* [2005] (**binding affinity**)
- 39F: Antigens were designed to attempt to target immune responses toward the IgG1b12 epitope, while minimizing antibody responses to less desirable epitopes. One construct had a series of substitutions near the CD4 binding site (GDMR), the other had 7 additional glycans (mCHO). The 2 constructs did not elicit b12-like neutralizing antibodies, but both antigens successfully dampened other responses that were intended to be dampened, while not obscuring b12 binding. V3 MAbs (447-52D, 19b, F245-B4e8 and 39F) bound to the GDMR antigen, but either did not bind or had diminished binding to mCHO. Selvarajah *et al.* [2005] (**vaccine antigen design**, **vaccine-specific epitope characteristics**)
- 39F: CXCR4-using HXBc2 strain and CCR5-using YU2 strain differed from each other in amino acid residues 325 and 326 at the base of the V3 loop. Changing the residues 325 and 326 in the HXBc2 from the amino acids predominant in the CXCR4-using strains to amino acids predominant in the CCR5-using strains did not result in binding of 39F to HXBc2. Xiang *et al.* [2005] (**antibody binding site definition and exposure**, **co-receptor**)
- 39F: By adding N-linked glycosylation sites to gp120, epitope masking of non-neutralizing epitopes can be achieved leaving the IgG1b12 binding site intact. This concept was originally tested with the addition of four glycosylation sites, but binding to b12 was reduced. It was modified here to exclude the C1 N-terminal region, and to include only three additional glycosylation sites. This modified protein retains full b12 binding affinity and it masks other potentially competing epitopes, and does not bind to 21 other MAbs to 7 epitopes on gp120, including 39F. To inhibit 39F binding, Arg 304 and Lys 305 had to be changed to Ala. Pantophlet *et al.* [2004] (**vaccine antigen design**)
- 39F: HIV-1 gp160deltaCT (cytoplasmic tail-deleted) proteoliposomes (PLs) containing native, trimeric envelope glycoproteins from R5 strains YU2 and JRFL, and X4 strain HXBc2, were made in a physiologic membrane setting as candidate immunogens for HIV vaccines – 2F5 bound to gp160deltaCT with a reconstituted membrane ten-fold better than the same protein on beads – anti-CD4BS MAbs IgG1b12 and F105, A32 (C1-C4), C11 (C1-C5), and 39F (V3) MAbs bound gp160deltaCT PLs indistinguishably from gp160deltaCT expressed on the cell surface. Grundner *et al.* [2002]
- 39F: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-2999) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. Kwong *et al.* [2002] (**antibody binding site definition and exposure**)
- 39F: Uncleaved soluble gp140 (YU2 strain, R5 primary isolate) can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif or using a T4 trimeric motif derived from T4 bacteriophage fibritin – stabilized oligomer gp140 delta683(-FT) showed strong preferential recognition by NAbs IgG1b12 and 2G12 relative to the gp120 monomer, in contrast to poorly neutralizing MAbs F105, F91, 17b, 48d, and 39F which showed reduced levels of binding, and C11, A32, and 30D which did not bind the stabilized oligomer. Yang *et al.* [2002]

- 4148: This Ab was shown to neutralize SF162 and the neutralization sensitivity increased in the SF162 variant with a JR-FL V3 loop, SF162(JR-FL V3). In contrast, a great reduction in sensitivity to neutralization was observed in the SF162(JR-FL V1/V2) variant and was somewhat restored in the SF162(JR-FL V1/V2/V3) variant, indicating that the masking of the V1/V2 loop plays a much greater role in restricting neutralization sensitivity than the variations in V3. This Ab was shown to neutralize viruses with V3 sequences from several different subtypes (B, F, A1, C, CRF02_AG and H) except subtype CRF01_AE. This Ab failed to neutralize SF162(JR-FL V1/V2) with V3 derived from different HIV-1 clades indicating effective V1/V2-mediated masking of several HIV-1 clades. The effect on the neutralization sensitivity of the

residue at the crown of the V3 loop (position 18) was shown to be low for this Ab.
- 4148D: V1V2 was determined to be the region that conferred the neutralization phenotype differences between two R5-tropic primary HIV-1 isolates, JRFL and SF162. JRFL is resistant to neturalization by many sera and MAbs, while SF162 is sensitive. All MAbs tested, anti-V3, -V2, -CD4BS, and -CD4i, (except the broadly neutralizing MAbs IgG1b12, 2F5, and 2G12, which neutralized both strains), neutralized the SF162 pseudotype but not JRFL, and chimeras that exchanged the V1V2 loops transferred the neutralization phenotype. 5/6 anti-V3 MAbs, including 4148D, had similar binding affinity to soluble SF162 and JR-FL rgp120s, although the V3 loop differs at three positions (HigpgrafyTtgE for JR-FL and TigpgrafyAtgD for SF162). - A1g8: The MAb B4e8 binds to the base of the V3 loop, neutralizes multiple primary isolates and was studied for interaction with other MAbs. B4e8 enhanced binding of CD4i MAbs 4.8d, 1.7b, and A1g8 to R5X4 virus 92HT593, but only of 48d to the R5 virus 92US660, and there was only a modest impact of the combination of B4e8 and CD4i MAbs on neutralization. Cavacini *et al.* [2003] (**antibody interactions**, **co-receptor**)
- A1g8: This study examined antibody interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4 isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate. Anti-V3 MAb B4a1 increased binding of CD4i MAbs 48d, 17b and A1g8, but only A1g8 binding was increased by B4a1 to the R5 isolate. Additive affects on neutralizaton of the R5X4 isolate with B4a1 and CD4i MAbs was observed, presumably due to increased exposure of the CD4i binding site, but not for the R5 isolate. Anti-gp41 MAb F240 had a synergistic effect on neutralization with CD4i MAbs 48d and 17b, but not with A1g8 for the R5X4 virus. Cavacini *et al.* [2002] (**antibody interactions**, **co-receptor**, **variant cross-recognition or cross-neutralization**)

Keywords neutralization

- 1121: Two HIV-1 isolates, NL4-3 and KB9, were adapted to replicate in cells using the common marmoset receptors CD4 and CXCR4. The adaptation resulted in a small number of changes of env sequences in both isolates. The adapted NL4-3 variants were generally more sensitive to neutralization by 1121 than the adapted KB9 variants. All of the NL4-3 exhibited similar sensitivity to neutralization by 1121 except for the viruses containing the V242I change, which exhibited a slight increase in neutralization sensitivity to 1121. Wildtype KB9 is resistant to neutralization by 1121 but the changes associated with adaptation to marmoset receptors resulted in variants with increased sensitivity to neutralization by 1121. Thus, adaptation to marmoset receptors resulted in an increase in sensitivity to neutralization by 1121 for KB9 but not for NL4-3. Pacheco *et al.* [2008] (**neutralization**)
- 1121: Ab neutralization of viruses with mixtures of neutralization-sensitive and neutralization-resistant envelope glycoproteins was measured. It was concluded that binding of a single Ab molecule is sufficient to inactivate function of an HIV-1 glycoprotein trimer. The inhibitory effect of the Ab was similar for neutralization-resistant and -sensitive viruses indicating that the major determinant of neutralization potency of an Ab is the efficiency with which it binds to the trimer. It was also indicated that each functional trimer on the virus surface supports HIV-1 entry independently, meaning that every trimer on the viral surface must be bound by an Ab for neutralization of the virus to be achieved. Yang *et al.* [2005c] (**neutralization**)
- AG1121: SHIV-HXBc2 is a neutralization sensitive non-pathogenic virus, and several *in vivo* passages through monkey's yielded highly pathogenic SHIV KU-1 – HXBc2 and the KU-1 clone HXBc2P3.2 differ in 12 amino acids in gp160 – substitutions in both gp120 and gp41 reduced the ability of sCD4, IgG1b12, F105 and AG1121 to Env achieve saturation and full occupancy, and neutralize KU-1 – 17b and 2F5 also bound less efficiently to HXBc2P3.2, although 2G12 was able to bind both comparably. Si *et al.* [2001]
- AG1121: Called 1121 – Virus with the V1-V2 loop deleted was viable and more susceptible to neutralization by CD4i MAb 17b, and anti-V3 MAbs 1121, 9284, and 110.4, but not to and CD4BS MAb F105 or sCD4. Cao *et al.* [1997b]
- AG1121: Recognizes monomeric gp120 from T-cell adapted line HXBc2 and primary isolate 89.6 equally well, but 89.6 was three-fold less sensitive to neutralization by AG1121 than HXBc2. Sullivan *et al.* [1995]

- Ag1211: Thermodynamics of binding to gp120 was measured using isothermal titration calorimetry for sCD4, 17b, b12, 48d, F105, 2G12 and C11 to intact YU2 and the HXBc2 core. The free energy of binding was similar, and not only CD4 but MAb ligands induced thermodynamic changes in gp120 that were independent of whether the core or the full gp120 protein was used. Non-neutralizing CD4BS and CD4i MAbs had large entropy contributions to free energy (mean: 26.1 kcal/mol) of binding to the gp120 monomer, except the potent CD4BS neutralizing MAb b6 had a much smaller value of 5.7 kcal/mol. High values suggest surface burial or protein folding and ordering of amino acids. Variable loop MAbs (L17, L78, 19b, 39F, Ag1211, D0142, and G3-2999) MAbs that bind to the N and C termini (211/c, A32, L100, P35, and C11) do not have dramatic entropy changes. These results suggest that while the trimeric Env complex has four surfaces, a non-neutralizing face (occluded on the oligomer), a variable face, a neutralizing face and a silent face (protected by carbohydrate masking), gp120 monomers further protect receptor binding sites by conformational or entropic masking, requiring a large energy handicap for Ab binding not faced by other anti-gp120 Abs. - B4a1: The MAb B4e8 binds to the base of the V3 loop, neutralizes multiple primary isolates and was studied for interaction with other MAbs. The anti-V3 MAb B4a1 cross-competes with B4e8. Cavacini *et al.* [2003] (**antibody interactions**)
- B4a1: This study examined antibody interactions, binding and neutralization with a B clade R5 isolate (92US660) and R5X4 isolate (92HT593). Abs generally bound and neutralized the R5X4 isolate better than the R5 isolate. Anti-gp41 MAb F240 binding was not affected by the binding of the V3 loop MAb B4a1, but preincubation with F240 could enhance B4a1 binding of the R5 isolate. B4a1 reacts with many B clade isolates, and preincubation with sCD4 enhances binding to both the R5

B Cell

and R5X4 isolates. B4a1 increased binding of CD4i MAbs 48d, 17b and A1g8, as well as CD4BS MAbs IgG1b12 and F105 to R5X4 virions, but only A1g8 and IgG1b12 binding was increased by B4a1 to the R5 isolate. Additive affects on neutralizaton of the R5X4 isolate with B4a1 and CD4i MAbs was observed, presumably due to increased exposure of the CD4i binding site, but not for the R5 isolate. B4a1 had an additive affect on neutralization with 2G12 with the R5X4 virus but not the R5 virus, and did not impact 2F5 neutralization. Keywords antibody binding site definition and exposure, antibody generation, antibody interactions, antibody sequence variable domain, co-receptor, neutralization, structure, variant cross-recognition or cross-neutralization

- B4e8: The crystal structure of the B4e8 Fab fragment in complex with a 24-mer V3 peptide (RP142) at 2.8 A resolution is described. B4e8 recognizes a novel V3 loop conformation, featuring a five-residue alpha-turn around the conserved GPGRA apex of the beta-hairpin loop and interacts primarily with V3 through side-chain contacts with just two residues, Ile(P309) and Arg(P315), while the remaining contacts are to the main chain. The structure can explain how B4e8 can tolerate a certain degree of sequence variation within V3 and, hence, is able to neutralize different HIV-1 isolates. Bell *et al.* [2008] (**variant cross-recognition or cross-neutralization**, **structure**)
- B4e8: B4e8 neutralized 7 of the 15 subtype B isolates tested, of which 6 were resistant to neutralization by MAbs 19b, 39F, CO11, F2A3, F530, LA21 and LE311. Angle of interaction between B4e8 and V3 was shown by superimposing the Fab fragment of the Ab with V3. B4e8 was shown to interact with V3 from a slightly elevated angle relative to the MAbs 58.2 and 447-52D. Pantophlet *et al.* [2008] (**antibody binding site definition and exposure**, **neutralization**, **structure**)
- B4e8: The epitope for the MAb D19 is conserved and embedded in V3. D19 is unique in that for R5 viruses, it was cryptic and did not bind without exposure to sCD4, and for X4 and R5X4 isolates it was constitutively exposed. It had an overlapping binding region with MAbs 447-52D, B4e8, and 268-D, but different reactivity patterns and fine specificity. While B4e8 and 447-52D could bind to the R5 virus BaL in the absence of sCD4, treatment with sCD4 did increase the binding of both B4e8 and 447-52D, but did not impact their ability to neutralize BaL. Lusso *et al.* [2005] (**antibody binding site definition and exposure**)
- B4e8: This MAb binds to the base of the V3 loop, and binds and neutralizes multiple primary isolates. The anti-V3 MAb B4a1 cross-competes with B4e8. B4e8 and 2G12 enhanced each others binding, and gave synergistic neutralization. B4e8 could neutralize R5X4 virus 92HT593 better than 2G12, while 2G12 was better at neutralizing R5 virus 92US660. B4e8 enhanced binding of CD4i MAbs 4.8d, 1.7b, and A1g8 to 92HT593, but only of 48d to the 92US660, and there was only a modest impact of the combination of B4e8 and CD4i MAbs on neutralization. CD4BS MAb IgG1b12 had no effect on B4e8 binding. Anti-gp41 MAb F240 inhibited B4e8 neutralization. Cavacini *et al.* [2003] (**antibody binding site definition and exposure**, **antibody generation**, **antibody interactions**, **co-receptor**, **variant cross-recognition or cross-neutralization**)
- B4e8: The effect of isotype (IgG1 and IgG3) and subtype (IgA) switching of parental F425B4e8 (IgG2)on HIV-1 binding and neutralization was investigated. IgG1-and IgA-F425B4e8 mutants showed virus-specific binding levels and TCLA SF2 isolate compared to the parental IgG2. Comparable levels of neutralization of primary isolates 92HT593 (R5X4) and 92US660 (R5) was achieved by all isotypes and subtypes of F425B4e8. Liu *et al.* [2003] (**variant cross-recognition or cross-neutralization**, **antibody sequence variable domain**)
- B4e8: Called F425 B4e8. scFv 4KG5 reacts with a conformational epitope that is formed by the V1V2 and V3 loops and the bridging sheet (C4) region of gp120 and is influenced by carbohydrates. Of a panel of MAbs tested, only NAb b12 enhanced 4KG5 binding to gp120 JRFL. MAbs to the following regions diminished 4KG5 binding: V2 loop, V3 loop, V3-C4 region, CD4BS. MAbs directed against C1, CD4i, C5 regions didn't impact 4KG5 binding. These results suggest that the orientation or dynamics of the V1/V2 and V3 loops restricts CD4BS access on the envelope spike, and IgG1b12 can uniquely remain unaffected by these loops. This was one of the V3 MAbs used. Zwick *et al.* [2003] (**antibody interactions**)

Keywords antibody binding site definition and exposure, antibody generation, isotype switch, mucosal immunity, neutralization, variant cross-recognition or cross-neutralization

- D47: Several IgG MAbs were isotype switched to IgA and tested for their abilities to generate immune complexes with HIV-1 and be excreted from polarized epithelial cells from the basolateral to the apical surface via polymeric Ig receptor (pIgR) binding. IgA D47 showed robust excretion abilities which corresponded to increased binding of D47 to HIV, and, as immune complex with the virus, to pIgR. The excretion of the D47-HIV complex was IgA Ab concentration dependent, as well as time dependent, depending on on the duration of basolateral exposure of the immune complexes. Immune complexes with D10 plus D47 showed synergistic abilities, as the binding and excretion increased significantly with both Abs present than with only one of the Abs. D47 excreted non-infectious virus, correlating with it being a neutralizing Ab. These results show that IgA Abs have potential to excrete HIV from mucosal lamina propria thus decreasing the viral burden and access to susceptible cells. Wright *et al.* [2008] (**isotype switch**, **mucosal immunity**)
- D47: D47 did not compete with the newly defined neutralizing mAb m44 for binding to gp41. Zhang *et al.* [2008]
- D47: By isotype switching, IgG and IgA variants of D47 were produced. Both D47 IgA and IgG neutralized virus in conventional neutralization assays, however, IgA performed better. D47 IgA was also internalized into the cells by the polymeric Ig receptor (pIgR) and showed capability of intracellular neutralization of HIV-1, while D47 IgG showed no such activity. The extent of intracellular neutralization was shown to be dependent on the concentration of D47 IgA. D47 IgA also inhibited production of virus. Huang *et al.* [2005b] (**isotype switch**, **neutralization**, **mucosal immunity**)
- D47: sCD4 can activate fusion between effector cells expressing Env and target cells expressing coreceptor (CCR5 or CXCR4) alone without CD4 – V3 MAb D47 is strain specific and can inhibit sCD4 mediated infection, but only of the closely related LAV Env, while anti-CD4i MAbs were broadly cross-neutralizing. Salzwedel *et al.* [2000] (**variant cross-recognition or cross-neutralization**)
- D47: Used for comparison in a study of gp41 antibodies – D47 binds to a greater extent to cell surface expressed Env than any of 38 conformation dependent anti-gp41 MAbs. Earl *et al.* [1997]
- D47: Binds both gp120 and soluble gp120+gp41 complex efficiently, suggesting its gp120 epitope is not blocked by gp41 binding. Wyatt *et al.* [1997] (**antibody binding site definition and exposure**)
- D47: Pulse label experiments of MAb binding to noncleavable gp160 revealed that this anti-V3 MAb bound immediately and binding stayed constant through chase period. Otteken *et al.* [1996]
- D47: Used for capture of oligomeric Env for antigen capture ELISA – binding of this antibody to oligomeric Env IIIB was not blocked by human sera from the US, consistent with a low prevalence of IIIB-like V3 strains. Richardson *et al.* [1996] (**antibody binding site definition and exposure**)
- D47: Generated during a study of the influence of the oligomeric structure of Env in determining the repertoire of the Ab response. Earl *et al.* [1994] (**antibody generation**)

References Hewer & Meyer 2002

- A synthetic peptide immunogen designated a multiple epitope immunogen (MEI) was generated by synthesizing peptides with mixtures of frequently found amino acids (>10%) from the C subtypes allowed in the synthetic peptide – when injected into mice, the C subtype MEI induced antibodies that recognized the immunogen and whole virus as an antigen in ELIZAs – sera from eight HIV positive South Africans recognized the MEI peptide in ELISA tests. Hewer & Meyer [2002]

Keywords rate of progression, subtype comparisons

- Ab responses at diluations above 1:1000 against the consensus V3 loops of subtypes A, B, C, D, F, and Brazilian B and F, were detected in only 6/60 individuals infected with HIV by sexual exposure, while a significantly higher (38/46) reactivity and frequency of peptide recognition was observed in the plasma of IDUs. High Ab titers (> 1:10,000) were directed against V3B, V3Bbr and V3F peptides. The IDU group also displayed broader NAb responses, in comparison to the sexually transmitted group. This may contribute to a slower disease progression in IDUs. Bongertz *et al.* [2003] (**subtype comparisons**, **rate of progression**)

Species (Isotype) guinea pig (IgG)
Ab Type gp120 V3
References Yang *et al.* 2004
Keywords co-receptor

- Neutralizing antibodies against V3 with greater breadth among B clade viruses were created in vaccinated guinea pigs using a combination gp140ΔV1V2 and shortened V3 loop envelope than using intact Envelope. The interior V3 glycosylation site was removed in the modification of V3. This change also caused the virus to become CXCR4 tropic. Yang *et al.* [2004] (**co-receptor**)

Keywords antibody binding site definition and exposure, review, subtype comparisons, variant cross-recognition or cross-neutralization

- 1367: Called 1367-D. The neutralization potency of this Ab against 7 HIV-1 primary isolates was compared to the neutralization potency of the Ab KD-247. Higher concentrations of 1367-D were needed for the neutralization of all of the HIV-1 isolates suggesting a lower neutralization potency of this Ab. Eda *et al.* [2006b] (**variant cross-recognition or cross-neutralization**)
- 1367: One of 24 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster I region (aa 579 - 604). Only one of these has any neutralizing potential, clone 3. Gorny & Zolla-Pazner [2004] (**review**)
- 1367: A cluster I epitope that binds to rgp41 567-647, recognizes a peptide N51-C43 complex trimer of heterodimers that approximates the core of the fusogenic form of gp41 – this MAb doesn't react with either of the peptides N51 or C43 individually – MAbs 50-69 and 1367 had similar properties. Gorny & Zolla-Pazner [2000] (**antibody binding site definition and exposure**)
- 1367: Binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, but gp41 MAb 50-69 bound with a 5 fold preference for the oligomer, while other gp41 MAbs (1367, 98-6, 167-D, 1281, 1342, and 1379) did not show a preference. Gorny *et al.* [2000] (**antibody binding site definition and exposure**)
- 1367: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 5 cluster I anti-gp41 MAbs which showed good cross clade reactivity – 1367 weakly bound to the majority of isolates – no neutralizing activity was observed when tested with 5 isolates, but 1367 did not bind well to these isolates. Nyambi *et al.* [2000] (**subtype comparisons**)
- 1367: Using a whole virion-ELISA method, 18 human MAbs were tested for their ability to bind to a panel of 9 viruses from clades A, B, D, F, G, and H – anti-gp41 Abs 98-6, 1367 and 1342 were not able to bind detectably with any of the viruses from any clade. Nyambi *et al.* [1998] (**subtype comparisons**)

Keywords antibody binding site definition and exposure, antibody generation, assay development, HAART, ART, neutralization, vaccine antigen design

- 7B2: 7B2 was shown to bind to Envs used in typical epitope binding assays, unlike the neutralizing Abs 8K8, DN9, and D5 used in this study. Nelson *et al.* [2008]
- 7B2: Sera from both gp120 DNA prime-protein boost immunized rabbits and from protein-only immunized rabbits did not compete for binding to 7B2, indicating no elicitation of 7B2-like Abs by either of the immunization regimens. Vaine *et al.* [2008] (**vaccine antigen design**)
- 7B2: Most of the sera from guinea pigs immunized with gp120 protein or with three types of VLPs containing disulfide-shackled functional trimers (SOS-VLP), uncleaved nonfunctional Env (UNC-VLP), and naked VLP bearing no Env, weakly or ineffectively inhibited 7B2. HIV-1 + plasma strongly inhibited this Ab, and high inhibition was also found in three of the VLP-sera. Crooks *et al.* [2007] (**neutralization**)
- 7B2: In addition to gp120-gp41 trimers, HIV-1 particles were shown to bear nonfunctional gp120-gp41 monomers and gp120-depleted gp41 stumps on their surface. 7B2 recognizes trimeric and monomeric gp41 stumps. Thus, it did not neutralize wildype virus particles but it could capture virus efficiently. It is hypothesized that the nonfunctional monomers on the HIV-1 surface serve to divert the Ab response, helping the virus to avoid neutralization. Moore *et al.* [2006] (**antibody binding site definition and exposure**, **neutralization**)
- 7B2: Of 35 Env-specific MAbs tested, only 2F5, 4E10, IgG1b12, and two CD4BS adjacent MAbs (A32 and 1.4G) and gp41 MAbs (2.2B and KU32) had binding patterns suggesting polyspecific autoreactivity, and similar reactivities may be difficult to induce with vaccines because of elimination of such autoreactivity. 7B2 has no indication of polyspecific autoreactivity. Haynes *et al.* [2005a] (**antibody binding site definition and exposure**)
- 7B2: A reverse capture assay was developed to asses what kind of human MAbs were produced in EBV B-cell transformation assays performed on PBMC sampled at different timepoints from three HIV-1 infected patients on HAART. The reverse capture assay was validated by the solid phase MAbs that could not capture biotin-MAbs of the same or overlapping specificity when reacted with patient virus envelope glycoproteins preincubated with or without sCD4. Detection of gp41

B Cell

Abs in the assay was based on the fact that they would capture cleaved gp41 and thus be detected by binding to biotin-labeled gp41 Abs recognizing non-competing sites. Reverse capture assay showed that the produced Abs from the patients were detected by biotin-labeled 7B2 in a mixture with 2.2B, indicating presence of gp41 Abs. Robinson *et al.* [2005] (**antibody generation**, **assay development**, **HAART, ART**)

- 7B2: The SOS mutant envelope protein introduces a covalent disulfide bond between gp120 surface and gp41 transmembrane proteins into the R5 isolate JR-FL by adding cysteines at residues 501 and 605. Pseudovirions bearing this protein bind to CD4 and co-receptor bearing cells, but do not fuse until treatment with a reducing agent, and are arrested prior to fusion after CD4 and co-receptor engagement. gp41 Abs 7B2 and 2.2B did not neutralize in any format, WT, SOS, nor when added postbinding. Binley *et al.* [2003] (**vaccine antigen design**)
- 7B2: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. Binley *et al.* [1999] (**antibody binding site definition and exposure**)

- 126-6: NIH AIDS Research and Reference Reagent Program: 1243.
- 126-6: 126-6 blocked 2F5 and 13H11 binding to gp41 epitopes to variable degrees. MAb 126-6 showed strong binding to HIV-1-positive infected cells. Alam *et al.* [2008] (**antibody interactions**)
- 126-6: This Ab did not inhibit HIV-1 BaL replication in macrophages or in PHA-stimulated PBMCs. Holl *et al.* [2006a] (**neutralization**, **dendritic cells**)
- 126-6: One of 19 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster II region (aa 644-663); none have neutralizing activity. Gorny & Zolla-Pazner [2004] (**review**)
- 126-6: Anti-gp41 MAbs were tested in a cell-cell fusion system to investigate the antigenic changes in gp41 during binding and fusion. Cluster I MAbs 50-69, F240, 240-D,3D6, and 246-D recognize a nonhelical hydrophobic region, positions 598-604, that forms a disulfide loop in the six-helix bundle. Cluster II MAbs 98-6 and 126-6 recognized residues 644-663 of gp41, a portion of the second heptad repeat. These MAbs were found to behave similarly, so 50-69 and 98-6 were used as representatives. Exposure of cluster I and cluster II epitopes required CD4 expression on HIV HXB2 Env expressing HeLa target cells, but not the CXCR4 co-receptor. Binding to CD4 exposed hidden cluster I and II epitopes. The MAbs were found to bind to gp120/gp41 complexes, not to gp41 after shedding of gp120, and were localized to at fusing-cell interfaces. Kinetic and binding results indicate that these MAbs are exposed in transitional structures during the fusion process, possibly the prehairpin intermediate prior to co-receptor binding, although other intermediate structures may be involved. They do not bind once syncytia begin to show extensive cyotplasmic mixing. These MAbs failed to inhibit fusion. The NAb 2F5 has a very different behavior in this study. Finnegan *et al.* [2002] (**antibody binding site definition and exposure**, **kinetics**)
- 126-6: This cluster II MAb binds to a conformational epitope in the region 644-663 – like most cluster II MAbs (126-6, 167-D, 1281, 1342, and 1379 all reacted similarly) it binds to a peptide N51-C43 complex trimer of heterodimers that approximates the core of the fusogenic form of gp41, but not to C43 nor to N51 alone – MAb 126-6 was biotinylated and used as a probe to determine that anti-gp41 MAb 50-69 bound the fusogenic form of the protein in liquid phase. Gorny & Zolla-Pazner [2000] (**antibody binding site definition and exposure**)
- 126-6: 26 HIV-1 group M isolates (clades A to H) were tested for binding to 47 MAbs, including 6 cluster II anti-gp41 MAbs – of these 2F5, 167-D, 126-6, and 1281 bound across clades, but usually weakly, while 98-6 and 1342 had poor cross reactivity – Clade D isolates bound most consistently to cluster II MAbs. Nyambi *et al.* [2000] (**variant cross-recognition or cross-neutralization**, **subtype comparisons**)
- 126-6: Discontinuous epitope recognizing residues between 649-668 – designated cluster II – Fabs D5, D11, G1, T3, M12, M15, S6, S8, S9, S10 block binding. Binley *et al.* [1996] (**antibody binding site definition and exposure**)

B Cell

- 126-6: One of several anti-gp41 MAbs that bind to a gp41-maltose binding fusion protein designed to study the leucine zipper domain of gp41, showing that the construct has retained aspects of normal gp41 conformation. Chen *et al.* [1995] (**antibody binding site definition and exposure**)
- 126-6: Called SZ-126.6. Eddleston *et al.* [1993]
- 126-6: No enhancing or neutralizing activity. Robinson *et al.* [1991] (**enhancing activity**)
- 126-6: Specific for a conformational epitope. Xu *et al.* [1991] (**antibody binding site definition and exposure**)

- 1379: One of 19 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster II region (aa 644-663); none have neutralizing activity. Gorny & Zolla-Pazner [2004] (**review**)
- 1379: This cluster II MAb binds to a conformational epitope in the region 644-663 – like most cluster II MAbs (126-6, 167-D, 1281, 1342, and 1379 all reacted similarly) it binds to a peptide N51-C43 complex trimer of heterodimers that approximates the core of the fusogenic form of gp41, but not to C43 nor to N51 alone. Gorny & Zolla-Pazner [2000] (**antibody binding site definition and exposure**)
- 1379: Binds within the region gp41 647-682 – binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, but gp41 MAb 50-69 bound with a 5 fold preference for the oligomer, while other gp41 MAbs (1367, 98-6, 167-D, 1281, 1342, and 1379) did not show a preference. Gorny *et al.* [2000] (**antibody binding site definition and exposure**)

- 2.2B: In addition to gp120-gp41 trimers, HIV-1 particles were shown to bear nonfunctional gp120-gp41 monomers and gp120-depleted gp41 stumps on their surface. 2.2B recognizes trimeric and monomeric gp41 stumps. 2.2B did not neutralize wildype virus particles but it was able to capture the virus efficiently. It is hypothesized that the nonfunctional monomers on the HIV-1 surface serve to divert the Ab response, helping the virus to avoid neutralization. Moore *et al.* [2006] (**antibody binding site definition and exposure**, **neutralization**)
- 2.2B: Of 35 Env-specific MAbs tested, only 2F5, 4E10, IgG1b12, and two CD4BS adjacent MAbs (A32 and 1.4G) and gp41 MAbs (2.2B and KU32) had binding patterns suggesting polyspecific autoreactivity, and similar reactivities may be difficult to induce with vaccines because of elimination of such autoreactivity. Haynes *et al.* [2005a] (**antibody binding site definition and exposure**)
- 2.2B: A reverse capture assay was developed to asses what kind of human MAbs were produced in EBV B-cell transformation assays performed on PBMC sampled at different timepoints from three HIV-1 infected patients on HAART. The reverse capture assay was validated by the solid phase MAbs that could not capture biotin-MAbs of the same or overlapping specificity when reacted with patient virus envelope glycoproteins preincubated with or without sCD4. Detection of gp41 Abs in the assay was based on the fact that they would capture cleaved gp41 and thus be detected by binding to biotin-labeled gp41 Abs recognizing non-competing sites. Reverse capture assay showed that the produced Abs from the patients were detected by biotin-labeled 2.2B in a mixture with 7B2, indicating presence of gp41 Abs. Robinson *et al.* [2005] (**antibody generation**, **assay development**, **HAART, ART**)
- 2.2B: The SOS mutant envelope protein introduces a covalent disulfide bond between gp120 surface and gp41 transmembrane proteins into the R5 isolate JR-FL by adding cysteines at residues 501 and 605. Pseudovirions bearing this protein bind to CD4 and co-receptor bearing cells, but do not fuse until treatment with a reducing agent, and are arrested prior to fusion after CD4 and co-receptor engagement. gp41 Abs 7B2 and 2.2B did not neutralize in any format, WT, SOS, nor when added postbinding. Binley *et al.* [2003] (**vaccine antigen design**)
- 2.2B: Ab binding characteristics of SOS gp140 were tested using SPR and RIPA – SOS gp140 is gp120-gp41 bound by a disulfide bond – NAbs 2G12, 2F5, IgG1b12, CD4 inducible 17b, and 19b bound to SOS gp140 better than uncleaved gp140 (gp140unc) and gp120 – non-neutralizing MAbs 2.2B (binds to gp41 in gp140unc) and 23A (binds gp120) did not bind SOS gp140. Schulke *et al.* [2002] (**vaccine antigen design**)
- 2.2B: The MAbs with the broadest neutralizing activity, IgG1b12, 2G12 and 2F5, all have high affinity for the native trimer, indicating that they were raised in an immune response to the oligomer on the virion surface rather than dissociated subunits – a disulfide linked gp120-gp41 (SOS gp140) was created to mimic the native conformation of Env and explore its potential as an immunogen – SOS gp140 is recognized by NAbs IgG1b12, 2G12, and CD4-IgG2, and also by anti-V3 MAbs 19b and 83.1 – SOSgp140 is not recognized by C4 region MAbs that neutralize only TCLA strains, G3-42 and G3-519 – nor did it bind C11, 23A, and M90, MAbs that bind to gp120 C1 and C5, where it interacts with gp41 – MAbs that bind CD4 inducible epitopes, 17b and A32 were very strongly induced by CD4 in SOS gp140 – anti-gp41 MAbs that bind in the region that interacts with gp120, 7B2, 2.2B, T4, T15G1 and 4D4, did not bind to SOSgp140, in contrast to 2F5, which binds to the only gp41 epitope that is well exposed in native gp120-gp41 complexes. Binley *et al.* [1999] (**vaccine antigen design**)

- D5: D5 scFv and D5 IgG, along with C-peptide inhibitors of different sizes, were used to determine if the pocket region of the gp41 N-trimer is specifically protected by a steric block. The smaller D5 scFv was 4 times more potent than the larger D5 IgG in inhibiting HIV entry. In contrast, in an in vitro binding assay, 5-10 fold more IgG than scFv bound to target. This disparity indicates that there is a steric block at the

B Cell

pocket region. N-trimer was shown to be sterically protected from inhibitors and NAbs approaching from both the cell side and the virus side, and that the N-trimer block is present also on a CD4-activated virus. It is suggested that the source of the steric block is derived from viral factors, such as gp120. Eckert *et al.* [2008] (**antibody binding site definition and exposure**)
- D5: Synergy of 2F5 with MAbs 2G12, D5, and peptide C34 was examined. 2F5 exhibited synergy in inhibition of HIV-1 89.6 with MAb 2G12, D5 and peptide C34. In combination with a matured D5 variant (2-75), the synergistic effect was increased. D5 and 2F5 contributed equally to the observed synergy. It is suggested that 2F5 and D5 have complementary roles, binding to distinct but adjacent Env trimers on the same virion, thereby synergistically preventing formation of fusion pores. Hrin *et al.* [2008] (**antibody interactions**)
- D5: The potency of D5 was 2-3 times lower than the potency of new neutralizing Fab 3674 in neutralization of laboratory and primary strains of HIV-1. Gustchina *et al.* [2007] (**neutralization**)
- D5: D5 structure, binding, neutralization, and strategies that can be used for vaccine antigen design to elicit anti-gp41 Abs, are reviewed in detail. Lin & Nara [2007] (**review**)
- D5: This review provides information on the HIV-1 glycoprotein properties that make it challenging to target with neutralizing Abs. D5 neutralization properties and binding to HIV-1 envelope, and current strategies to develop versions of the Env spike with functional trimer properties for elicitation of broadly neutralizing Abs, are discussed. In addition, approaches to target cellular molecules, such as CD4, CCR5, CXCR4, and MHC molecules, with therapeutic Abs are reviewed. Phogat *et al.* [2007] (**review**)
- Fab D5: Called D5. One of 19 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster II region (aa 644-663); none have neutralizing activity. Gorny & Zolla-Pazner [2004] (**review**)

- T3: The study compared Ab neutralization against the JR-FL primary isolate and trimer binding affinities judged by native PAGE. There was direct quantitative relationship between monovalent Fab-trimer binding and neutralization, implying that neutralization begins as each trimer is occupied by one Ab. In BN-PAGE, neutralizing Fabs and sCD4 were able to shift JR-FL trimers, In contrast, most non-neutralizing Fabs, T3 in particular, bound to monomer, but their epitopes were conformationally occluded on trimers, confirming the exclusive relationship of trimer binding and neutralization. Crooks *et al.* [2008] (**neutralization**, **binding affinity**)
- T3: T3 bound to N35ccg-N13 peptide, which is a soluble homotrimer corresponding to the HIV-1 gp41 NHR region, and to recombinant r-gp41 (HXB2), indicating that the T3 epitope is present on the N35ccg-N13 peptide. T3 did not neutralize HXB2. As other human-derived Abs in this study, T3 has a long CDR H3 (19 residues), and it was shown to bind to Envs used in typical epitope binding assays, unlike the neutralizing Abs in this study. While T3 had no observable reactivity with a peptide corresponding to the C-heptad repeat of gp41 (C34), low nanomolar concentrations of C34 were sufficient to induce recognition of IZN36 (another mimetic peptide) by T3. The neutralizing Abs in this study were, however, able to recognize IZN36 without C34. T3 was able to inhibit mAb D5 binding to immobilized 5-Helix, but it did not have any effect on the neutralization potency of D5 against HXB2, indicating that T3 cannot bind to the fusogenic NHR trimers. Nelson *et al.* [2008] (**neutralization**, **binding affinity**, **antibody sequence variable domain**)
- T3: In addition to gp120-gp41 trimers, HIV-1 particles were shown to bear nonfunctional gp120-gp41 monomers and gp120-depleted gp41 stumps on their surface. T3 did not bind to trimers nor monomers but it did recognize gp41 stumps from which gp120 had dissociated. T3 was able to capture wildtype virus particles. The capture occurs with moderate efficiency, probably through gp41 stumps on viral surface. It is hypothesized that the nonfunctional monomers on the HIV-1 surface serve to divert the Ab response, helping the virus to avoid neutralization. Moore *et al.* [2006] (**antibody binding site definition and exposure**)
- Fab T3: Called T3. One of 19 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster II region (aa 644-663); none have neutralizing activity. Gorny & Zolla-Pazner [2004] (**review**)

- Md-1: NIH AIDS Research and Reference Reagent Program: 1223.
- Md1: Md1 reacted with maltose-binding proteins MBP30 and MBP32, containing both HR1 and HR2 domains of gp41, but did not react with MBP37 and MBP44, containing only the HR2 domain, nor with MBP-HR1, containing only the HR1 domain. In addition, Md1 bound to MBP44/N36 and MBP-HR1/C34 complexes reaching a plateau at a concentration of $\sim$ 1 µg/ml. In ELISA, Md1 reacted with the complex formed between MBP-HR1 and H44 (His-targeted protein) and C34, but failed to recognize the mixture of MBP-HR1 and T20, MBP3 and C34, and MBP3 and H44. In addition, Md1 recognized the peptide complex N36/C34 but not the peptides individually. Vincent *et al.* [2008] (**antibody binding site definition and exposure**)
- Md-1: Point mutations in the highly conserved structural motif LLP-2 within the intracytoplasmic tail of gp41 resulted in conformational alternations of both gp41 and gp120. The alternations did not affect virus CD4 binding, coreceptor binding site exposure, or infectivity of the virus, but did result in decreased binding and neutralization by certain MAbs and human sera. Md-1 bound with similar levels to both the LLP-2 mutant and wildtype viruses, indicating that the ologomeric potential of the LLP-2 mutanat Env was not altered. Kalia *et al.* [2005] (**antibody binding site definition and exposure**, **binding affinity**)
- Md-1: One of 19 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster II region (aa 644-663); none have neutralizing activity. Gorny & Zolla-Pazner [2004] (**review**)
- Md-1: Discontinuous epitope recognizing residues between 563-672, does not recognize cluster I disulfide bridge region – reacts almost exclusively with trimers and tetramers on WB – designated cluster II – Fabs D5, D11, G1, T3, M12, M15, S6, S8, S9, S10 block binding. - 1281: One of 19 MAbs and Fabs in this database that bind to the highly immunogenic gp41 cluster II region (aa 644-663); none have neutralizing activity. Gorny & Zolla-Pazner [2004] (**review**)
- 1281: Alanine mutations were introduced into the N- and C-terminal α-helices of gp41 to destabilize interhelical packing interactions in order to study their inhibitory effect on viral infectivity. These mutations were shown to inhibit viral replication though affecting the conformational transition to the fusion-active form of gp41, and allow increased inhibition by gp41 peptides. 2F5 senstivity is increased in the mutated viruses, presumably because 2F5s neutralization activity is focused on the transition to the fusion active state. No other gp41 MAb against tested, including NC-1, 50-69D, 1281, 98-6D, 246-D and F240, neutralized the parental or the fusion-deficient mutated viruses. Follis *et al.* [2002] (**antibody binding site definition and exposure**)
- 1281: The fusion process was slowed by using a suboptimal temperature (31.5 C) to re-evaluate the potential of Abs targeting fusion intermediates to block HIV entry – preincubation of E/T cells at 31.5 C enabled polyclonal anti-N-HR Ab and anti-six-helix bundle Abs to inhibit fusion, indicating six-helix bundles form prior to fusion – 98-6 binds to a C-HR hairpin epitope and blocks fusion when added to a 2 hour E/T preincubation at 31.5 C, but if added after 1 hour, doesn't inhibit – this is in contrast to six-helix bundle Abs 167-D and 1281 that inhibit more efficiently when added after one hour of incubation. Golding *et al.* [2002b] (**antibody binding site definition and exposure**)
- 1281: A panel of 12 MAbs was used to identify those that could neutralize the dual-tropic primary isolate HIV-1 89.6 – six gave significant neutralization at 2 to 10 ug/ml: 2F5, 50-69, IgG1b12, 447-52D, 2G12, and 670-D six did not have neutralizing activity: 654-D, 4.8D, 450-D, 246-D, 98-6, and 1281 – no synergy, only additive effects were seen for pairwise combinations of MAbs, and antagonism was noted between gp41 MAbs 50-69 and 98-6, as well as 98-6 and 2F5. Verrier *et al.* [2001] (**antibody interactions**)
- 1281: This cluster II MAb binds to a conformational epitope in the region 644-663 – like most cluster II MAbs (126-6, 167-D, 1281, 1342, and 1379 all reacted similarly) it binds to a peptide N51-C43 complex trimer of heterodimers that approximates the core of the fusogenic form of gp41, but not to C43 nor to N51 alone. Gorny & Zolla-Pazner [2000] (**antibody binding site definition and exposure**)
- 1281: Binds within the region gp41 647-682 – binding of panel of 21 MAbs to soluble oligomeric gp140 versus gp41 or gp120 monomers was compared – no MAb was oligomer specific, but gp41 MAb 50-69 bound with a 5 fold preference for the oligomer, while other gp41 MAbs (1367, 98-6, 167-D, 1281, 1342, and 1379) did not show a preference. Gorny *et al.* [2000] (**antibody binding site definition and exposure**, **variant cross-recognition or cross-neutralization**)
- 1281: Called 1281-D: Four primary isolates showed distinct patterns of sensitivity to neutralization by polyclonal sera or plasma and MAbs – BZ167 was the only isolate inhibited by all polyclonal sera and plasma tested, and was also neutralized by 8/17 MAbs, in particular anti-V3 loop (419-D, 447-52D, 782-D, and 838-D), anti-CD4bd (559/64-D, 654-D and 830-D and a cluster II of gp41 directed MAb (98-6) – isolates 92HT593 and 91US056 were neutralized by V3 loop (419-D, and 447-52D)and cluster II gp41 (98-6) MAbs at higher concentrations – US4 was neutralized by some of the polyclonal

Keywords antibody binding site definition and exposure, computational epitope prediction, neutralization, review, structure, vaccine antigen design

- CG10: This review summarizes data on the role of NAb in HIV-1 infection and the mechanisms of Ab protection, data on challenges and strategies to design better immunogens that may induce protective Ab responses, and data on structure and importance of mAb epitopes targeted for immune intervention. The importance of standardized assays and standardized virus panels in neutralization and vaccine studies is also discussed. Srivastava *et al.* [2005] (**antibody binding site definition and exposure**, **neutralization**, **vaccine antigen design**, **review**)
- CG10: Using 17b MAb to select peptides from a combinatorial library, and analyzing the peptides using a novel discontinuous epitope reconstruction program, enabled epitope prediction. Segments of gp120 were reconstructed as an antigenic protein mimetic recognized by 17b. Comparisons then were made with a similar prediction of contact residues for CG10, a CD4i MAb that competes with 17b, but has a distinct binding site. Enshell-Seijffers *et al.* [2003] (**antibody binding site definition and exposure**, **computational epitope prediction**, **structure**)
- CG-10: Called CG10. Using a cell-fusion system, it was found CD4i antibodies 17b, 48d, and CG10 reacted faintly with Env expressing HeLA cells even in the absence of sCD4 or CD4 expressing target cells. Reactivity increased after sCD4 addition, but not after CD4 expressing target cell addition, and binding was not increased at the cell-to-cell CD4-Env interface. This suggests the CD4i co-receptor binding domain is largely blocked at the cell-fusion interface, and so CD4i antibodies would not be able access this site and neutralize cell-mediated viral entry. Finnegan *et al.* [2001] (**antibody binding site definition and exposure**)
- CG-10: Called CG10 – disrupts gp120-CCR5 interaction and competes with MAb 17b –binds near the conserved bridging sheet of gp120 – mutations in positions K/D 121, T/D 123, K/D 207, K/D 421, Q/L 422, Y/S 435, M/A 434, K/A 432 and I/S 423 result in a 70% reduction in CG10 binding. Rizzuto *et al.* [1998]
- CG-10: Called CG10 – CD4BS MAb 15e competes with CG-10 binding, probably due to the disruption of CD4-gp120 by 15e – CD4i MAbs 17b and 48d compete and the binding sites may overlap – MAb A32 enhances binding of 17b, 48d and CG10 – MAbs C11, 2G12 and 212A do not affect CG10 binding – CG-10 can bind gp120 with V1/V2 and V3 deleted – HXBc2 mutations Delta 119-205, 314 G/W, 432 K/A, 183,184

B Cell

PI/SG decrease CG-10 recognition, HXBc2 mutations Delta 298-327 (V3), 384 Y/E, 298 R/G, 435 Y/S enhance recognition – the CD4 contribution to the CG10 epitope maps to the CD4 CDR2-like loop – CG10 can neutralize HIV-1 in the presence of sCD4 even though it does not do so in the context of cell surface CD4 binding to gp120. Sullivan *et al.* [1998b]
- CG-10: Called CG10 – Promotes envelope mediated cell fusion between CD4+ cells and cells infected with either T-cell and macrophage tropic viruses – infection of HeLa CD4+ (MAGI) cells by HIV-1 LAI, ELI1, and ELI2 strains was increased two-to four-fold in the presence of CG10. Lee *et al.* [1997]
- CG-10: Called CG10 – MIP-1alpha binding to CCR-5 expressing cells can be inhibited by gp120-sCD4, and MAb CG10 does not block this inhibition. Wu *et al.* [1996]
- CG-10: Reacts exclusively with sCD4-gp120 complex, not with sCD4 or gp120 alone. Gershoni *et al.* [1993]

- NC-1: NC-1 failed to inhibit HXB2 and SF162 infectivity in the Env-pseudotyped virus neutralization assay, and did not enhance the inhibitory activity of N36Mut(e,g) peptide, which is a class 3 inhibitor that disrupts trimerization of the N-heptad repeat (N-HR) in the prehairpin intermediate by sequestering the N-HR into N-HR/N36Mut(e,g) heterodimers. Gustchina *et al.* [2008] (**neutralization**, **kinetics**)
- NC-1: NC-1 bound to N35ccg-N13 peptide, which is a soluble homotrimer corresponding to the HIV-1 gp41 NHR region, and to recombinant r-gp41 (HXB2), indicating that the NC-1 epitope is present on the N35ccg-N13 peptide. NC1 recognized gp140HXB2(-), in which the cleavage site has been knocked out, but it did not recognize cleavage competent gp160 HXB2 (+) that had been detergent-liberated from infectious virions. While NC-1 had no observable reactivity with a peptide corresponding to the C-heptad repeat of gp41 (C34), low nanomolar concentrations of C34 were sufficient to induce recognition of IZN36 (another mimetic peptide) by NC-1. The neutralizing Abs in this study were, however, able to recognize IZN36 without C34. Nelson *et al.* [2008]
- NC-1: NC-1 did not compete with the newly defined neutralizing mAb m44 for binding to gp41. NC-1 bound strongly to 5HB, 6HB and recombinant gp140. NC-1 bound to 5HB and 6HB in a way similar to mAb T3. Zhang *et al.* [2008] (**binding affinity**)
- NC-1: This Ab was used to verify that the constructed HA/gp41 chimeric protein expressed on cell surfaces did not form post-fusion six-helix bundle structure since this Ab is specific for HIV gp41 in this conformation. No interaction between the HA/gp41 and NC-1 was observed indicating that the chimeric protein did not assume the post-fusion conformation, which is thought to be ineffective in eliciting neutralizing Abs. Ye *et al.* [2006] (**antibody binding site definition and exposure**, **binding affinity**)
- NC-1: The MAb 2F5 binds to the C-heptad and is neutralizing, but the MAb D50 binds to the C-heptad and is not neutralizing. 2F5 binds preferentially to native gp41 prior to receptor activation. Trapped fusion-intermediates suggest 2F5 remains present shortly after gp120 triggering by CD4, but may be lost by the time the six-helix bundle is formed. 2F5 neutralization seems to block a later step of the fusion process, but it does not inhibit binding of NC-1, a MAb specific for the six-helix bundle, so it does not prevent formation of the six-helix bundle. The results are most consistent with 2F5 inhibiting a post-fusion-intermediate step. de Rosny *et al.* [2004b] (**antibody binding site definition and exposure**, **antibody interactions**)
- NC-1: The mechanism of 2F5 neutralization was explored, and experiments suggest it is due to interference with a late step in viral entry. 2F5 does not block six-helix bundle formation, as 2F5 prebinding does not inhibit NC-1 binding, a MAb that binds specifically to the six-helix bundle. de Rosny *et al.* [2004a] (**antibody binding site definition and exposure**)
- NC-1: Alanine mutations were introduced into the N- and C-terminal alpha-helices of gp41 to destabilize interhelical packing interactions in order to study their inhibitory effect on viral infectivity. These mutations were shown to inhibit viral replication though affecting the conformational transition to the fusion-active form of gp41, and allow increased inhibition by gp41 peptides. 2F5 senstivity is increased in the mutated viruses, presumably because 2F5s neutralization activity is focused on the transition to the fusion active state. No other gp41 MAb against tested, including NC-1, 50-69D, 1281, 98-6D, 246-D and F240, neutralized the parental or the fusion-

B Cell

deficient mutated viruses. Follis *et al.* [2002] (**antibody binding site definition and exposure**)

- NC-1: Uncleaved soluble gp140 can be stabilized in an oligomer by fusion with a C-term trimeric GCN4 motif (gp140delta683(-/GCN4)) or using a T4 trimeric motif derived from T4 bacteriophage fibritin (gp140delta683(-/FT)) – NC-1 binds to 15% of the GCN4 motif trimers, but this was significantly reduced for the T4 fibritin stabilized structures, indicating little is in the six-helix bundle, fusogenic conformation. Yang *et al.* [2002] (**antibody binding site definition and exposure**)
- NC-1: A combination of gp41 fusion with the GNC4 trimeric sequences and disruption of the YU2 gp120-gp41 cleavage site resulted in stable gp140 trimers (gp140-GNC4) – approximately 16% of the gp140(-GNC4) stabilized trimer recognized by pooled sera was precipitated by NC-1, indicating that at a fraction assumes a fusogenic gp41 six-helix bundle conformation – gp140(-) monomers were not able to bind to the NC-1, nor was gp130(-/GCN4) glycoprotein, consistent with the expectation that the absence of C34 helices would preclude formation of the six-helix bundle. Yang *et al.* [2000] (**antibody binding site definition and exposure**)
- NC-1: Ab elicited in response to immunization with N36(L6)C34, a peptide that folds into a six helix bundle like gp41 – NC-1 binds to the surface of HIV-1 infected cells only in the presence of sCD4, recognizing the fusogenic core structure – binding affinity was decreased by point mutations that disrupt core formation and abolish membrane fusion activity, (I573P and I573A) – NC-1 can recognize discontinuous epitopes from B clade isolate SC, but not E clade strain N243, O group strain GAB, or HIV-2 ROD. Jiang *et al.* [1998] (**antibody binding site definition and exposure**, **antibody generation**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)

References Yamada & Iwamoto 1999
Keywords ADCC, antibody binding site definition and exposure, antibody generation, complement, rate of progression

- Antibody responses to overlapping 9-mers from the Nef protein were mapped in a set of HIV+ Japanese hemophiliacs. Long term non-progressors among the group were significantly more likely to react to Nef peptide 31 (FLKEKGGLE) ($p=0.008$). Rabbit polyclonal Abs were raised against this peptide. These Abs bound Nef, could kill infected cells in a complement dependent manner, and the domain near peptide 31 was exposed on the surface of infected T-cells. Yamada & Iwamoto [1999] (**ADCC**, **antibody binding site definition and exposure**, **antibody generation**, **complement**, **rate of progression**)

Epitope FLKEKGGLE
Neutralizing
Immunogen HIV-1 infection
Species (Isotype) human
References Yamada *et al.* 2004
Keywords ADCC, rate of progression

- Plasma and PBMC from long term non-progressors can mediate ADCC against Nef infected target cells. Addition of the peptide FLKEKGGLE reduces this activity by half. Patients who were LTNPs were found to make antibodies against this peptide in an earlier study. Anti-Gag antibodies do not elicit ADCC, and Pol proteins are not expressed on the cell surface, in contrast to this Nef epitope. Yamada *et al.* [2004] (**ADCC**, **rate of progression**)

Immunogen vaccine
Vector/Type: protein *Strain:* B clade NL43
HIV component: Nef *Adjuvant:* Complete Freund's Adjuvant (CFA)
Species (Isotype) mouse (IgM)
References Kanduc *et al.* 2008; Otake *et al.* 1997
Keywords antibody binding site definition and exposure, antibody generation

- E5: Similarity level of the E5 binding site pentapeptide GMDDP to the host proteome was low, with the low-similarity 5-mer occurring in the host proteome 1 time, indicating that this peptide can be used to elicit Abs for active/passive immunotherapy with low risk of cross-reaction with the host proteome. Kanduc *et al.* [2008]
- E5: BALB/c mice were immunized with Nef protein to create a series of anti-Nef antibodies. E5 bound to the peptide spanning amino acids 170-181; we inferred the amino acids from the positions in the NL-43 strain. E5 also bound to the complete Nef protein. Otake *et al.* [1997] (**antibody binding site definition and exposure**, **antibody generation**)

Species (Isotype) mouse (IgG1)
References Moureau *et al.* 2002

- Nef encapsulated in poly(DL-lactide-co-glycolide) (PLG) had a more prolonged Ab response than Nef in PBS or in Freund's adjuvant (CFA), still strong after 7 months – the response was predominantly IgG1, a Th2 immune response – three linear epitopes, Nef 32-64, 118-167, and 185-205, were frequently recognized by the sera of mice immunized with NefPLG or Nef-CFA, but not after immunization with Nef in PBS, which seemed to preferentially stimulate an Ab response to conformational epitopes. References Voss *et al.* 2003
Keywords adjuvant comparison, variant cross-recognition or cross-neutralization

- Monkeys were immunized with different combinations of gp120/NefTat/SIV-Tat three times over a three-month time period and intravenously challenged with SHIV 89.6P four weeks after the last immunzation. Vaccination induced anti-Tat, -Nef and -gp120 Ab responses that decreased until challenge. Neutralizing Ab responses against HIV-1 MN and HIV-1 W61D were observed. Vaccination with the combination of all three proteins reduced viral load and kept animals from a CD4+ T cell decline, preventing AIDS for more than 2.5 years. The adjuvant AS02A elicited NAbs and protected from disease, while AS06 did not. gp120 alone or TatNef/SIV-Tat without gp120 could not protect from disease. - The greatest amino acid diversity is found in sites in the HIV genome that are spanned by antibody epitopes. Sites spanned by CTL epitopes, not but not by antibody epitopes, showed reduced amino acid diversity even in comparison to non-epitope sites. However, mutations within CTL epitopes were more likely to be convergent than mutations within antibody epitopes. These patterns were consistent both in Gag and Env. Keywords dendritic cells, kinetics, neutralization

- Inhibition of R5 HIV replication by monoclonal and polyclonal IgGs and IgAs in immature monocyte-derived dendritic cells (iMDDCs) was evaluated. It was shown that anti-HIV IgG was able to inhibit HIV-1 replication more efficiently in iMDDCs than in PBLs, while no such activity was observed for polyclonal IgA. The kinetics of IgG addition suggested that the inhibition occurred early in HIV infection. No induction of maturation was observed. Two mechanisms of HIV inhibition in iMDDCs by IgG are described: i) neutralization of HIV infectivity by Fab parts of IgG, and ii) inhibition of HIV infection via FcγRII or FcγRI expressed on target cells. Keywords acute/early infection, dynamics, early treatment, HAART, ART

- The influence of ART on the HIV-specific antibody titers during primary HIV-1 infection was examined in treated and untreated individuals as well as individuals that discontinued ART. It was found that the Ab levels gradually increased in untreated patients, and continued to increase after the viral load set point, until approximattely 40 weeks postinfection when an Ab plateau was reached. Early ART-treated patients had low Ab titers associated with an early and substantial reduction in virus replication. Patients that discontinued early ART experienced a rebound of virus replication associated with a rapid rise in Ab titer. The results indicate that early ART influences typical evolution of HIV-1 specific Ab response. Killian *et al.* [2006] (**acute/early infection**, **dynamics**, **early treatment**, **HAART, ART**)

Keywords acute/early infection, dynamics, early treatment, HAART, ART

- This study examined the impact of early HAART on antibody quality and production in patients with primary HIV-1 infection by comparing traeted and untreated patients. Responses against pol, env and gag were analysed. HAART affected the concentration of all anti-HIV IgG subclasses studied, as treated patients showed lower Ab responses. However, HAART did not change the ratio between the Ab subclasses. Furthermore, the avidity of anti-HIV-1 IgG did not differ between the two patient groups, indicating that the effect of HAART is only quantitative and limited to the final stages of the anti-HIV B-cell response. References Deeks *et al.* 2006
Keywords acute/early infection, autologous responses, neutralization, variant cross-recognition or cross-neutralization

- Neutralizing Ab responses were measured against autologous and heterologous isolates in acutely and chronically HIV-1 infected patients. Individuals with acute infection showed lower neutralizing Ab response against both autologous and heterologous viruses than the chronically infected patients, and had a higher neutralizing titers directed against earlier viruses than against contemporaneous viruses. In chronically infected patients, the level of neutralizing Abs against heterologous viruses was positivelly correlated with the level of viremia, indicating that HIV replication continuously drives the production of of Abs that cross-neutralize primary isolates. Furthermore, the correlation of neutralizing Abs against autologous viruses and viremia was negative, indicating that these Abs may contribute to the control of HIV-1 replication. In addition, neutralizing Ab response against contemporaneous viruses in chronic infection could be detected, although it was low. These results suggest that there might exist limits to the capacity of HIV-1 to evolve continuously in response to neutralizing Abs. Keywords autologous responses, escape, mother-to-infant transmission, neutralization

- The role of maternal autologous NAbs in selective transmission of HIV-1 escape variants to their infants was examined. In utero transmitting mothers were significantly less likely to have autologous NAbs at delivery than nontransmitting mothers, while no difference between intrapartum transmitters and nontransmitters was observed. In addition, the infecting HIV-1 strains found in the infants were more closely related to maternal autologous NAb escape variants, suggesting that neutralizing Abs may have both protective and selective effects. However, sequence analyses of these HIV-1 strains, transmitted in the presence of maternal NAbs, showed that they had features of both sensitive and escape maternal HIV-1 strains. It is suggested that NAb sensitive strains were transmitted from the mothers to their children, and that these strains rapidly evolved to acquire escape mutations due to the presence of maternal NAbs in the infants. These results suggest that neutralizing Abs can promote rapid evolution of HIV-1 in infected children. Keywords autologous responses, HAART, ART, neutralization

- The amount of env gene diversity, the lengths of variable loops, and the number of N-linked glycosylation sites were observed lower in elite supressors (ES) than in patients on HAART and in untreated chronically infected individuals. Also, the titers of NAbs against two HIV-1 lab strains was shown to be lower in ES and HAART-treated patients than in untreated viremic individuals. However, despite these differences, the titers of NAb against autologous virus did not differ significantly between the three groups of patients. In addition, there was no difference in the titer of NAbs against plasma viruses and against proviral variants in the ES. These results suggest that NAb do not play a dominant role in the maintainance of viral supression in elite supressors. Keywords binding affinity, HAART, ART, memory cells

- The avidity of anti-HIV-1 IgG during HAART was observed to progressively decrease in patients, however, the B-cell subset depleted at the chronic stage of infection was shown to increase during the treatment. The increase concerned the naive B-cells secreting new antibodies with low affinity as the HIV antigen levels are lower under HAART. Investigation of the cellular, humoral and innate immune responses showed that HAART induced different immune restoration patterns in patients. It is suggested that the IgG avidity index is a weak marker of the restoration of humoral immune function in HIV-1 infected patinents under HAART. - A subset of B cells was shown to bind gp120 through mannose C-type lectin receptors (MCLRs), mainly DC-SIGN. In the presence of gp120, these B cells proliferated and up-regulated AID, which induced class switching from IgM to IgG and IgA. Presence of IL-10 and IL-4 further augmented the class switching and IL4 also elicited class switching to IgE. The Ab secretion is managed by BAFF, which was up-regulated by gp120 interaction with CD4, CCR5 and CXCR4. Thus, gp120 can initiate polyclonal IgG, IgA and IgE responses. gp120-reactive Abs did not interfere with the ability of gp120 to bind and activate B-cells, while anti-gp120 Abs against the CD4bs augmented B-cell binding by increasing the exposure of CXCR4-binding sites on gp120. - In addition to gp120-gp41 trimers, HIV-1 particles were shown to bear nonfunctional gp120-gp41 monomers and gp120-depleted gp41 stumps on their surface. It was shown that Ab binding to trimers predicts neutralization, while non-neutralizing Abs bind to the nonfunctional forms of Env. HIVIG prepared from HIV-positive donor plasma targeted mainly monomers, suggesting that the monomers elicit strong Ab responses during natural infection. It is hypothesized that the nonfunctional monomers on the HIV-1 surface serve to divert the Ab response, helping the virus to avoid neutralization. - Macaques immunized with multivalent DNA encoding gp120 from subtypes A, B and E and p55 gag of subtype C followed by boost with homologous gp120 proteins developed strong humoral responses. The elicited anti-gp120 Abs were capable of neutralizing homologous and, to a lesser extent, heterologous HIV-1 isolates of subtypes A, B and C but not E. The Abs elicited during the primary immunization phase decayed but the responses could easily be boosted back to the original level with limited additional immunizations. One of the six immunized animals was protected from challenge by SHIV while the rest showed significant containment of plasma viremia compared to the control animals. The neutralization titer of anti-Env Abs to the challenge virus was not correlated to the challenge outcome. Keywords antibody binding site definition and exposure, neutralization, vaccine antigen design, variant cross-recognition or cross-neutralization

- gp120 alone and gp120 bound to CD4D12 (the first two domains of human CD4) or to M9 (a 27-residue CD4 analog) were used to immunize guinea pigs. Only sera from the gp120-CD4D12 immunized animals showed broadly neutralizing activity. This activity was shown to be exclusively due to anti-CD4D12 Abs. Abs targeting the CD4i epitope were generated by the gp120-CD4D12, but they were nonneutralizing. Keywords mother-to-infant transmission, neutralization, responses in children

- In a mother-child HIV-1 infected pair, neutralization of infant HIV-1 isolates was analyzed by contemporaneous and non-contemporaneous infant and maternal plasma. Neutralization assays suggested that most of the neutralizing Abs in the infant during the first months of life were of maternal origin, however, these were just a subset of maternal NAbs, since maternal plasma more effectively neutralized early infant virus than infant plasma did. The maternal humoral component in the child decreased over time, and increasing titers of NAbs were detected in non-contemporaneous child plasma after 12 months, indicating development of effective humoral immune responses in the infant. The de novo humoral responses in the child corresponded with an increase in Env diversity. Zhang *et al.* [2005b] (**neutralization**, **responses in children**, **mother-to-infant transmission**)

- The levels of Abs directed to the HR2 region of gp41 decreased following treatment of HIV-1 infected patients with T20. The depletion of these Abs by T20 suggests formation of T20-Ab complexes that may interfere with T20 treatment. Upon cessation of T20-treatment, the Abs to HR2 region returned to pre-treatment levels. The levels of Abs directed to other regions of gp41 and to gp120 remained stable after treatment with T20. Both sera from T20-treated and from T20-untreated patients did not recognize peptides representing the HR1-region of gp41. Vincent *et al.* [2005] (**antibody interactions**)

B Cell

- IgG purified from HIV-2 infected patient sera was shown to neutralize the majority of autologous viruses, including those isolated years later, indicating that neutralization escape is rare in HIV-2 infection. All HIV-2 sera also neutralized the majority of heterologous primary HIV-2 isolates, including an isolate of subtype B, suggesting that HIV-2 infection induces broadly neutralizing Ab responses. The neutralization sensitivity of HIV-2 isolates did not correlate with the number of N-linked glycosylation sites or the absence or presence of specific glycosylation sites. Keywords antibody binding site definition and exposure, drug resistance, escape, HAART, ART, neutralization

- Escape mutations in HR1 of gp41 that confer resistance to Enfuvirtide reduced infection and fusion efficiency and also delayed fusion kinetics of HIV-1. They also conferred increased neutralization sensitivity to a subset of neutralizing MAbs that target fusion intermediates or with epitopes exposed following receptor interactions. Enhanced neutralization correlated with reduced fusion kinetics, indicating that the mutations result in Env proteins remaining in the CD4-triggered state for a longer period of time. Viruses with escape mutations in HR1 were also more readily neutralized by sera from HIV-1 infected individuals than wildtype viruses, indicating that ENF therapy resulting in escape may lead to viruses with enhanced sensitivity to the immune response in vivo. Keywords neutralization, vaccine antigen design, variant cross-recognition or cross-neutralization

- The HIV-1 Env protein used in the immunizations was suggested to exhibit a conformation that HIV-1 proteins have after binding to the primary receptor, and was derived from a patient with broadly cross-reactive neutralizing Abs. Immunizations induced NAbs with broad cross-reactivity against heterologous strains of HIV-1 of the same subtype (B) and against other subtypes such as C, A/G and F, but not against subtypes E or D. NAbs also displayed cross-reactivity against a heterologous SHIV. Animals with higher levels of serum neutralizing activity were protected against infection by a heterologous SHIV challenge. Immunization was also associated with a reduction in the magnitude and duration of virus load in animals that got infected. References Mascola *et al.* 2005b
Keywords neutralization, vaccine antigen design, variant cross-recognition or cross-neutralization

- A boost with recombinant serotype 5 adenoviral vector (rAd5) in DNA-primed macaques resulted in a rapid rise of Ab titers, in contrast to little rise in Ab titers in sequentially rAd5-immunized animals. The neutralizing activity of plasma derived from the DNA-prime rAd5-boost animals was moderate. After a SHIV89.6P challenge, the animals developed a secondary NAb response to several heterologous viruses. These viruses belonged to the same subset of viruses that were neutralized after the primary immunization, indicating that the breadth of immunity elicited by the original vaccine immunogen is a limiting factor during the secondary Ab response. - JR-FL and YU2 HIV-1 strains were neutralized by IgG pooled sera from HIV-1 infected patients. Lab-adapted isolate-neutralizing Abs and other non-neutralizing Abs only recognized JR-FL cleavage-defective glycoproteins, while the neutralizing Abs (2G12 and IgG1b12) recognized both cleavage competent and cleavage-defective glycoproteins. The pooled sera recognized cleavage-competent glycoproteins at high concentrations, consistent with its lower neutralizing potency. It is suggested that an inefficient env glycoprotein precursor cleavage exposes non-neutralizing determinants, while only neutralizing regions remain accessible on efficiently cleaved spikes. For YU2, both cleavage-competent and -defective glycoproteins were recognized by both neutralizing and non-neutralizing Abs. - IgG from HIV-1 infected patients had greater neutralizing activity in monocyte-depleted PBMCs as target cells for virus growth, than in CD4+ lymphocytes. It was shown that the enhanced neutralizing activity in PBMCs was abrogated when they were depleted of NK-cells, which express Fc receptors for IgG. The enhanced neutralizing activity in PBMCs correlated with augmented β-chemokine production but it had rather small effect, indicating that the enhanced neutralization also depends on additional mechanisms. It is suggested that the virus inhibition is more effective in PBMC due to the interaction between the Fc segment on the antibody and the Fc-receptors on the NK cells. Part of the neutralization is due to β-chemokine production triggered by the Fc-receptor activation. Forthal *et al.* [2005] (**antibody interactions**, **neutralization**)

- The major infectivity and neutralization differences between a PBMC-derived HIV-1 W61D strain and its T-cell line adapted counterpart were conferred by the interactions of three Env amino acid substitutions, E440G, D457G and H564N. E440G mutation reduced infectivity and increased neutralization sensitivity to polyclonal Ig, D457G and H564N also increased neutralization sensitivity. Binding of the polyclonal HIVIg to gp120 was, however, not affected by any of these amino acid substitutions. Beddows *et al.* [2005b] (**neutralization**, **binding affinity**)

Keywords acute/early infection, complement, neutralization

- In all patients studied, IgG antibody-mediated complement inactivation (CMI) appeared at or shortly after the peak in viremia, 6 to 28 days after the onset of symptomatic primary HIV-1 infection (PHI). The CMI was effective on both autologous and heterologous HIV-1 isolates. In contrast, autologous and heterologous NAbs developed more than 200 days after symptomatic PHI. Activation of the classical complement pathway was largely responsible for the observed antiviral effects. Keywords autologous responses, co-receptor, kinetics, neutralization, rate of progression

- Antibody responses in eight individuals infected from a single source with nef-attenuated HIV-1 differed considerably between the individuals. Total strength of IgG responses was associated with viral load and virus replication kinetics, with strongest Ab responses observed for individuals with low but detectable viral-load set points. Stronger neutralizing Ab responses were also associated with better replicating viral strains, higher viral loads, and better strength of antiviral IgG responses. The presence of strong neutralizing Ab responses did not prevent disease progression. Keywords assay standardization/improvement, neutralization, review

- This minireview summarizes data on differences in neutralizing activities of MAbs and pooled human sera using a traditional primary cell neutralization assay and the more standardized TZM-bl reporter cell line assay. Also, suggestions are made on how to improve and standardize neutralization assays for comparable use in different laboratories. A large panel of polyclonal plasma pools from 6-10 pure clade plasmas derived from HIV-1 infected individuals from 6 different countries were tested against a panel of 60 HIV-1 primary isolates (10 each from clades A-D, CRF01_AE and CRF02_AG) in the two assays. Also, MAbs M9, M47, 2F5 and 4E10 were tested. There was 60% concordance in qualitative neutralizing activity measured by both assays where 47% of Ab sources were negative in both assays and 13% were concordant positive. Pooled polyclonal plasma neutralized all but one viruses tested in the TZM-assay while it did not neutralize 11 viruses in the PBMC assay. The assay discordances were shown to be bi-directional and not attributable to assay sensitivity. Polonis *et al.* [2008] (**neutralization**, **review**, **assay standardization/improvement**)

Keywords vaccine antigen design, variant cross-recognition or cross-neutralization

- Mice were immunized with plasmid DNA encoding p37gag of subtypes A and B, gp160 of subtypes A, B and C, and rev and RT of subtype B, where the vaccine plasmids were divided into two entities (one gag- and RT-encoding and one env- and rev-encoding) to avoid interference between the plasmids. The boost was performed using MVA encoding HIV-1 antigens encoding gp160 env of CRF01_AE and p55gag and pol of subtype A. Significantly higher Ab levels were induced in the DNA-prime MVA-boost animals than in MVA alone or DNA alone. The V3-specific response was highest for subtype B and CRF01_AE, while gp41 response was exclusively directed against subtype B. Bråve *et al.* [2007] (**vaccine antigen design**, **variant cross-recognition or cross-neutralization**)

Keywords genital and mucosal immunity, HIV exposed persistently seronegative (HEPS), review

- This review summarizes data on the IgG and IgA Ab responses at mucosal surfaces. The neutralizing and protective properties of IgG versus IgA responses are discussed, including discrepancies in the role of IgA Abs in protection against HIV infection. The discrepancies and difficulties in the detection of HIV-specific IgA are highlighted. Alexander & Mestecky [2007] (**genital and mucosal immunity**, **HIV exposed persistently seronegative (HEPS)**, **review**)

- Data on SHIV constructs used for vaccine development and passive immunization studies conducted with polyclonal and monoclonal Abs in SHIV/primate models is reviewed. Human neutralizing monoclonal Abs and their epitopes, and possible mechanisms to explain protection against infection are discussed. Also, differences in neutralization efficacy between the two mostly used neutralization assays, pseudovirus and PBMC, are reviewed. The implications of anti-HIV-1 Ab autoreactivity for active immunization and vaccine development are discussed. - The breadth and magnitude of NAb response was examined in macaques immunized with DNA prime-recombinant adenovirus boost vaccines encoding either single (subtypes B or C) or multiple (A+B+C) Envs, and challenged with SHIV-89.6P. Animals immunized with the multiple Env vaccine showed greater breadth and magnitude of NAb response against Tier 1 viruses following both vaccination and challenge compared to animals immunized with single Env only. There was no difference in NAb response in the different animal groups against Tier 2 viruses, with only limited NAb response, nor in the post-challenge NAb response against SHIV-89.6P. Keywords assay standardization/improvement, autologous responses, neutralization

- A reference panel of recently transmitted Tier 2 HIV-1 subtype B envelope viruses was developed representing a broad spectrum of genetic diversity and neutralization sensitivity. The panel includes viruses derived from male-to-male, female-to-male, and male-to-female sexual transmissions, and CCR5 as well as CXCR4 using viruses. Plasma samples from early infection were unable to neutralize the panel envelopes, while a much higher level of neutralizing activity was detected in plasma derived from chronically infected individuals. The early infection plasmas were also unable to neutralize contemporaneous autologous virus, but were able to neutralize the sensitive reference strains SF162 and NSC. Vector/Type: canarypox prime with gp120 boost, canarypox *Strain:* B clade *HIV component:* Env, Gag, gp120, Pol
Species (Isotype) human
References Cleghorn *et al.* 2007
Keywords neutralization, variant cross-recognition or cross-neutralization

- The safety and immunogenicity of canarypox virus-vectored vaccine alone, and in combination with recombinant envelope boost, was studied in four different regions: Brazil, Haiti, Peru, and Trinidad and Tobago. Anti-gag p24 and anti-gp120 Ab responses were detected in all vaccine groups, with the gp120-boost combination group having significantly higher response rates for gp120. HIV-1 SS1196.1 strain, which is unusually sensitive to neutralization by V3-specific Abs, was neutralized by sera from 12 of 14 vaccine recipients. There was a very weak heterologous neutralizing Ab response in all groups. Cleghorn *et al.* [2007] (**neutralization**, **variant cross-recognition or cross-neutralization**)

Immunogen HIV-1 infection
Species (Isotype) human (IgG, IgG3)
References Gorry *et al.* 2007
Keywords neutralization, rate of progression, review, variant cross-recognition or cross-neutralization

- Studies of viral evolution, pathogenicity, and immune responses to HIV-1 infection in members of the Sydney blood bank cohort (SBBC) infected with a nef-deleted HIV strain are reviewed. There was a good correlation between total IgG responses in the SBBC members and a detectable plasma viral load, where subjects who maintained undetectable RNA numbers had reduced IgG responses, and individuals with low but detectable viral load set points had the strongest Ab responses. Plasma from SBBC members with undetectable viral load was unable to neutralize nef-deleted viruses, and neutralization ability correlated with viral load, replication capacity of the virus, and the strength of IgG responses. Plasma from some SBBC members was able to neutralize a number of laboratory and primary HIV strains, including HIV-1 subtypes A, C, D, and CRF01_AE, indicating that infection with nef-deleted

References Konstantinopoulos *et al.* 2007

- The prevalence and nature of immunoglobulin abnormalities were studied in 320 HIV-1 infected patients. The abnormal protein electrophoresis patterns included oligoclonal and monoclonal banding, and were associated with increased viral load, female sex, younger age, and higher CD4 cell counts, indicating that patients with a more robust immune system are more likely to have augmented B-cell responses to HIV-1 infection. The majority of patients with monoclonal banding were receiving HAART. Females had higher average levels of IgG Abs then men, and a higher percentage of females had elevated IgG levels. Subtype C
Neutralizing
Immunogen HIV-1 infection
Species (Isotype) human
References Rademeyer *et al.* 2007
Keywords neutralization, subtype comparisons, variant cross-recognition or cross-neutralization

- Genetic features of subtype C viruses from HIV-1 infected individuals capable of eliciting cross-reactive neutralizing Abs against a panel of subtype B and C viruses were studied. Viruses genetically more similar to panel viruses were not more likely to elicit neutralizing Abs then genetically more distant viruses. There was also no correlation between the number of glycosylation sites and the capacity of the virus to induce neutralizing sera. However, for subtype C, viruses with shorter variable loops were more likely to induce cross-reactive Abs. This was not observed for subtype B viruses. Another finding supporting subtype-specific differences in neutralizing sensitivity was division of subtypes B and C in a hierarchical neutralization clustering dendogram. Rademeyer *et al.* [2007] (**neutralization**, **variant cross-recognition or cross-neutralization**, **subtype comparisons**)

References Russell *et al.* 2007
Keywords neutralization

- The safety and immunogenicity of the recombinant ALVAC-HIV vCP1452 vaccine was studied in groups of human volunteers, immunized with ALVAC alone or with ALVAC+gp120 boost. Anti-Gag p24 binding Abs were detected in all groups, indicating that administration of gp120 boost did not significantly enhance Gag-specific Ab responses. Neutralizing Ab titer to HIV-1 MN was higher in the groups receiving the gp120 boost. Neutralizing Ab responses to HIV-1 IIIB were less pronounced in all groups, however, the gp120 boost group had greater responses than the ALVAC alone group. There was no NAb activity against primary clade B isolates. Russell *et al.* [2007] (**neutralization**)

- Two vaccine products, a multi-gene plasmid DNA and a recombinant adenovirus serotype-5 (rAd5), were tested for elicitation of Ab responses in guinea pigs either with or without gp140 protein boost. Three immunizations with plasmid DNA and one immunization with rAd5 generated moderate levels of Env Ab responses that were boosted by 50-fold upon protein boosting. Moderatly high neutralization activity was observed in sera from immunized animals against BaL, SS1196, SF162 and HxB2 viruses, where the protein only immunized animals had higher neutralization against SF162 and HxB2 than the animals primed with DNA or rAd5. Neutralization activity against a panel of 12 reference clade B isolates showed moderate responses only against one strain, indicating that these immunigens do not elicit broadly reactive Abs. Using class B or C ODN as adjuvant in addition to MF59 did not augment the Ab responses.
